The dismal record of Workmen's Compensation litigation in those states where the private insurance industry writes the coverage should be convincing proof that no-fault health and accident benefits are not always paid promptly, generously, and amicably by the friendly insurance company. There is not only inordinate litigation in Workmen's Compensation cases over extent of injury and extent of disability, but the administration expense is high. The chart published by The Hart Committee shows administrative expense of 35¢ on the dollar, even though payments are on a scheduled basis and even though the industrial employer does almost all the work of investigating and reporting the accident.

No-fault Plans have no magic in themselves to produce a substantial cost saving. They promise real rate reductions only when combined with No-Pay provisions. A boy who buys a four ounce chocolate bar for ten cents, and then is told he has to buy a "cheaper" one ounce bar for a nickel, will figure out in time that he is being cheated.

WHAT DOES THE PUBLIC WANT?

We suppose that a Senator has considerable interest in listening to his constituents to find out what they want. All the polls taken so far show that the great majority believe in the fault system and want it retained. They also would like some first party benefits, if it does not cost too much, and they would like insurance company practices on cancellations and non-renewals and assigned risk plans straightened out.

In the State Farm Insurance Company survey of its policy holders the vote was 94% that "the driver who causes an accident, or his insurance company, should pay for the loss."

A major consumer research organization, Market Facts, Inc. did an extensive poll for Allstate, Kemper, Liberty Mutual and State Farm Insurance Companies, which proved that the public generally wants the fault system retained and wants general damages retained. One of the subjects tested was whether the public wants automobile property damage liability abolished, as S. 945 does, with the motorist allowed to buy only the deductible collision coverage. A majority disapproved. "Strong Disapproval" outranked "Strong Approval" more than 2 to 1.

"Pain and suffering damages" was explained, since 4 out of 5 people did not know what that insurance company trade jargon really meant. When people knew it included the disabilities included in general damages, they voted to keep compensation for general damages, for the driver in the right, by a solid 2.4 to 1 ratio. (The ratio was 3.3 to 1 against eliminating "pain and suffering" payments for people who had filed claims, and over 2 to 1 among people who had never filed a claim.) The D.O.T. "Public Attitudes" study confirmed the earlier polls.

The question was put. "In most states, this is how automobile liability insurance is set up now. If you are involved in an accident, you have a claim against another person or his insurance company only if you can prove that the other person *alone* is at fault. Would you say this is a good system, a bad system, or what?"

The public response was that it was satisfied, 2 to 1. The follow-up question is even more significant. It was: "In your opinion, is there a need to change this system?" A strong majority, 7 out of 10, said "No". Another 1 out of 10 said the proper change was to make recovery proportional (inversely) to fault. That is, 8 out of 10 citizens would approve, and would not wish to change, a fault system based on sole negligence or on comparative negligence.

The public opinion study clearly established that the public dissatisfaction with the present automobile reparations system had to do with unfair insurance company practices—cancellations, non-renewals, arbitrary classification and rating systems, and premium surcharges. High cost was, of course, a major complaint. It must be obvious that reform of insurance company practices, without abolition of present legal rights, would satisfy the public.

Apparently the A.I.A. knows that it has to "condition" the public to change its mind. A national advertising campaign has started to persuade people that the insurance companies will really treat them better. The ads being published are false, when compared to the true A.I.A. Plan and the Plan of S. 945. The ad by Firemen's Fund in "Time" for October 11, 1971, says "Your company pays your medical costs, your lost wages, and other out-of-pocket expenses." Both the A.I.A. Plan and S. 945 Plan pay out only a percentage of lost wages with strict upper limits. The ad also says: "And, if you're seriously injured, you can still sue the other driver." Not under S. 945 can you sue the other driver, and not under the A.I.A. Plan.

Travelers Insurance Company is running ads asking people to call, Toll-free, 800-243-0191, so they can explain. The writer did and asked the Traveler's voice if he could still sue the other driver if he came across the center line, collided head-on, and inflicted a crippled leg. "Of course," was the reply, "you can still sue the other driver if you're really hurt. It's just that we'll pay you \$2,000 in expenses without your having to go to a lawyer and sue anybody." That sounds like a very good plan. It is too bad that Traveler's has not proposed it to the Congress.

The most violent outrage against S. 945 will come on the elimination of property damage liability, because that feature will give bad treatment to millions of people every year. D.O.T. estimates, in its final report (p. 5), that 24 million vehicles are damaged each year, with a direct loss averaging \$200 for a total of 4.86 billion dollars. Using other D.O.T. figures, out of 13.6 million accidents 42% are rear-end collisions which means at least 5.7 million cars are involved in this type of accident and half will be smashed into from the rear. Just imagine the uproar when 2.65 million Americans find out that Congress has decreed they have no right to demand that the driver who hit them, or his insurance company, should pay the repair bill on that crumpled automobile—the pride of the owner, the extension of his personality, his most treasured and essential personal possession.

Surely the public wants to be treated fairly, and has a right to expect that government will provide justice regardless of wealth and regardless of class. S. 945 discriminates openly against the poor. The good driver, at a low economic level of income, can now rely on his good driving practices to assure him that if he is hit the other driver will be at fault and will have to pay both for his car damage and for his disability. Under S. 945, Committee Print I., the poor man will have to buy collision insurance which he can't afford, or suffer alone the whole damage loss to his car, which he can't afford either.

The man on a tight budget will have to abandon hope of obtaining full compensation for disability and suffering. He won't recover unless he has bought his own optional extra coverage. The well-to-do can buy full protection, provided it is not priced out of the market.

There is no doubt that this proposed Bill changes from an individual-rights oriented system to an individual wealth oriented system.

DO LAWYERS TAKE TOO MUCH

The propaganda line by no-fault proponents is that fee-crazy lawyers are to blame for all the ills of the insurance industry. "If only we could get rid of lawyers" say some insurance men, "we could deliver benefits more cheaply".

The true translation of that argument is that if only the insurance industry could get rid of lawyers, it could beat down the claimants with impunity. The only protection the consumer has is the lawyer and the only way most hard-pressed injury victims can afford to have a good lawyer is through the contingent fee system. The first man to reach the injury victim is the insurance adjuster in the vast majority of cases. The insurance company has every opportunity to settle directly. It does so, with no intervention by a lawyer, in six out of ten cases. (See D.O.T. "Public Attitudes" study, where only 39 per cent of all paid claimants had used a lawyer.) Only when the insurance company and the claimant disagree does the claimant hire a lawyer. In the 40 per cent of cases where a lawyer is retained, the vast majority are settled by agreement with no litigation. Using the D.O.T.'s own figures from its "Auto Accident Litigation" study, of its own estimate of 4.4 million injured, only 220 thousand ever filed a lawsuit, and of those few lawsuits, only 7 per cent went to verdict. That is, only 5 per cent of all injured victims ever file a lawsuit in court and only one-third of 1 per cent of all injury victims ever take the case to final verdict. This litigation takes only 17 per cent of all court time, which is a small proportion of time to spend adjudicating the rights of 100,000,000 licensed drivers who drive 100,000,000 licensed vehicles, driving a *trillion* miles a year on our highways in the greatest common activity of our people. Our courts spend about three times as much effort handling the criminal cases of muggers, rapists, dope peddlers, car thieves, murderers, and high class swindlers, embezzlers and financial thieves—which is a type of activity indulged in by a very small proportion of the population.

The injured man who can't get satisfaction from the insurance company, the ordinary citizen who needs the help of a lawyer, and gets a recovery only because he has a lawyer, is not complaining about lawyers. The complaint comes from the insurance industry, who would rather have the claimant defenseless, and from a few professors who never had to fight for a client's rights. The total payment out of the present system, to all lawyers for both plaintiff and defendant, is still *less* than the agent's commissions for selling the policy.

If lawyers should not be heard in defense of the fault system, then the private insurance industry should not be heard in support of first party health and accident systems. The financial stake of the insurance industry is vastly greater than the lawyer's stake, and their expense and profit ratio is a far greater percentage of the premium dollar. If the criterion for justice is solely the percentage cost of delivering benefits, then let us be fully consistent with economy and abolish the private insurance industry. The cry will be raised that government is wasteful, inefficient, and extravagant compared to private industry, but the undeniable fact remains that in those states where state funds pay workmen's compensation benefits, whether as sole insurer (as in Ohio) or in competition with private insurers (as in California) the state operated and managed fund pays out a far higher percentage of the premium dollar than any insurer ever has.

If the decision is made that the private insurance industry will retain the sole right to sell coverage for automobile reparations, then the public is entitled to retain the private lawyer for its own protection against that economic power.

IS THERE A GOOD NO-FAULT SYSTEM?

Every other major nation in the free world has studied its automobile reparations system and has evolved almost identical solutions. Society as a whole has some interest in patching up the victims of all accidents, and in easing the burden of lost wages. In Canada, Sweden, West Germany, France and England the present system is that everyone will get some first party benefits, and every *innocent* victim will get full compensation under a tort system; and for those relatively innocent, negligence will be compared and a fair proportion of general damages will be recovered from the other driver. Liability insurance must be carried with high limits—\$68,000 in U.S. dollar equivalent in West Germany, and in truly unlimited amounts in Great Britain. The driver has a right to private counsel and to trial. First party benefits are subject to a lien and repayment out of the liability insurance proceeds, generally speaking.

An argument can be made that a driver enjoys some kind of suicidal privilege to drive his own automobile any way he wants to so long as he is *risking only* his own neck. On the other hand no driver has any right to drive so *heedlessly* he risks the necks of other people. If a driver tries to take a curve at 90 and

winds up in the woods, there is no compelling moral reason why the good drivers of the country should help pay for all his losses. If, on the other hand, the same driver winds up across the median and ploughs into another car, there is every moral reason to demand that he make good the loss his conduct causes.

We have a partial no-fault system now, in that at least 8 out of 10 drivers carry Blue Cross, Blue Shield, Medical Pay, or similar first party protection. Many drivers also carry wage continuation or disability protection. It should be acceptable to put a rider on every liability policy requiring a combined economic loss payment. There is no real relationship between medical expense and wage loss. Either one may be high with the other one low. Allow each driver to treat his "economic loss" protection as primary, so that he can use it to offset either medical loss or wage loss and fill in the gaps on whatever first-party benefits he already pays for. The critical question is how big that first-pay economic loss rider should be. If it were just \$1,000, it would pay *in full* the total economic loss of every single accident victim. At that level, the cost should not exceed \$10.00 a year according to actuarial estimates reported to the writer, although here we must yield to detailed analysis from the insurance industry.

At a slightly higher level all the minor injury cases would be fully paid. Reference should be had to the D.O.T. final report "Motor Vehicle Crash Losses, etc.", pp. 4 & 5, where it is said that the estimated 3,750,000 personal injuries neither fatal nor "serious" (as defined) can be assumed to be "relatively minor in economic impact." D.O.T. estimated that the non-"serious" injuries had economic losses of a maximum of \$1,500. The *average* loss for this class of 3,750,000 injured motorists was only \$81.00 in wage loss, \$131.00 in medical loss, and other expenses of \$12.00. The numbers are said to be "based on unpublished data from the D.O.T.'s personal injury study."

To step up first party coverage to a level as high as \$2,500 would pay in full all the economic loss of 96% of all injury victims, and would of course pay that same amount to the other 4% to be added to whatever other coverage they carried. This kind of full protection for all but 4% of all victims would be far less costly to good drivers than the full payment to everyone, including the single car fatality cases, now envisioned by S. 945.

No restriction on the tort suit is required. There is no "threshold" anywhere else in the world—Manitoba, Saskatchewan, Ontario, Sweden, West Germany, France or England. The individual rights of our citizens to freedom from disability and suffering is just as precious as the right of those nationals.

A host of claims would drop out of the system by natural processes. Every lawyer and adjuster knows that many people with small losses would be happy to collect those losses and forget a claim for a few days of discomfort, but are compelled to threaten an injury suit in order to get their bills paid. If there were a lien on first party benefits so that they had to be repaid out of any tort proceeds (as is now done under the Florida Plan) there would be even greater deterrence to pressing the small claim.

Any "threshold" plan will necessarily work gross injustice in many individual cases. If any valid cost projection can prove that a "threshold" is essential—which we have excellent reason to doubt—then at most the threshold should be designed only to take truly minor, small claims out of the system. Some plans propose to preserve the tort remedy for full damages only for "permanent total disability". If the American citizen is compelled wrongfully to suffer *any* permanent disability, any loss of function of body or mind, he has sustained a real injury that ought to be compensated. (D.O.T. estimates: only 4% of all cases). The same is true of *any* degree of permanent disfigurement. (D.O.T. estimates: 2.5% of all cases.)

The injury victim who has to spend even 3 days and nights in the discomfort, the odor and the dehumanizing routine of a modern hospital has suffered real loss that ought to be paid, and the same is true if he has lost a week from work, or two weeks from normal activity, or \$200 in medical expenses. These modest levels of threshold would knock out over half of the claims now processed by the system.

The fact is the present level of bodily injury premium, which today takes a lower percentage of the average American's income than it did ten years ago, can pay all the tort claims without any threshold and still produce such a profit that rates will have to be cut.

The safety designs for automobiles, and for highway design, mandated by federal government in successive stages in 1966 and 1968 are beginning to take

effect as more old cars leave for the junkpile and more new roads are built and used. Accidents are down. Deaths are down, in total and percentage. All injury claims are down. Payouts are down, and casualty company profits on bodily injury coverage are riding high in 1971. State Farm, for example, announced an *underwriting* profit of \$112,000,000 for the first six months of 1971, part of which it will refund to policyholders. The sure way to reduce cost is to reduce injury.

Meanwhile the D.O.T. has purchased two specially engineered automobiles so designed that the driver can walk away from a fifty mile an hour head-on collision, survive a roll-over at seventy miles an hour, and sustain no damage at a front or rear impact of ten m.p.h. The D.O.T. has announced that it has ordered two more similar cars from other builders and will mandate the use of the best safety features of all four cars in future production automobiles. That will eliminate bodily injury premium cost problems and will eliminate most automobile litigation in a way that still preserves individual rights and individual justice.

In the intervening years there is no need to sacrifice individual justice on the altar of group security. No-fault Plans of the scope of S.945 are uncharted waters. Before we dive off the cliff into that shimmering pool, we ought to first climb down, wade out, and see how deep the water is. No one now knows what No-fault Plans will cost, what injustice they will produce, nor whether the public will find the actual working of the plans an outrage or a delight.

As the D.O.T. itself concluded in its final report, warning legislatures to move slowly and cautiously with incremental steps:

"Mere speculation without observation of the actual operation of a new system is an inadequate basis for immediate and fundamental changes of a national scope in an important area."

In short, let's test the new engine for bugs before we throw away the old one. A tune-up job may be all that's needed.

The questions and the answers thereto follow:

Question No. 1: In your testimony you state that it will cost about \$3 billion more per year to pay people for their "net economic losses". Would you present a detailed analysis of how you arrived at that figure? For example, what is the present premium level for bodily injury coverage? How much of that premium is available to auto accident victims for compensation of loss? What is the present deficiency of the tort liability system? What efficiency do you project for the insurance mechanism under Committee Print One? On what basis do you make that projection?

Answer to Question No. 1: In my testimony I estimated that it would take about 5 billion dollars a year more than the tort system now provides to pay in full the economic losses of the serious and fatal injury cases, and estimated that this would take about 8 billion dollars in premiums. Your question is phrased in terms of "net economic losses", which I do not understand inasmuch as the transcript at page 52, which you reference, does not contain any statement about "net economic losses."

The analysis I made is based on the assumption that the Department of Transportation study entitled "Economic Consequences of Automobile Accident Injuries" is a reasonably valid and honest statistical survey, based on accurate sampling methods.

The study states that of the whole class of persons defined as sustaining "serious" or "fatal" injury only 47.7% made any recovery in tort; and those with tort recovery recovered 60% of their loss; and the tort portion of that recovery was in turn 60% of the funds received from all sources. The portion of loss paid by tort, for the whole class, is thus derived by the equation $47.7\% \times 60\% \times 60\%$, which equals 17.2% (Reference, Table 3.17, page 47, "Economic Consequences").

The text of the same study says that aggregate economic losses for the whole class were 9.1 billion dollars on a "societal" basis, and 5.1 billion dollars if the personal and family loss basis is used. This latter figure is said to exclude about one billion dollars in future lost earnings of young adults who are potential wage earners. (Reference, "Economic Consequences" text, page 40). It seems to me that S. 945 is designed to pick up the future loss of the young adult, so that the total economic loss figure to be used in calculating the cost of S. 945 should be 6.1 billion dollars.

Cross reference should be made to Table 2, page 6, of the D.O.T. final report "Motor Vehicle Crash Losses and their Compensation in the United States".

which says that compensable economic loss from the 1967 accidents was \$10.5 billion for all victims; which would make the basic loss of \$5.1 billion for the serious and fatal cases seem to be a reasonable proportion. A further cross reference may be made to an article by Senator Hart in "Trial" magazine for October/November 1970, in which he said, page 27, that the one-half million serious injury and fatality victims of auto accidents in 1967 suffered \$5.1 billion of personal and family loss and recovered only \$813 million from the auto insurance fault system.

If the \$5.1 billion figure is correct, as the D.O.T. study says and as Senator Hart says, and if the recovery is 17.2% as the formula stated earlier predicts, then tort recovery should account for \$877 million. I do not know the source of Senator Hart's lower figure of \$813 million. In the same article, referenced above, he stated there was additional recovery of \$248 million from medical payments and collision coverage, which are non-fault coverages. The billion dollar additional future wage of the young adult about to enter the employment market should be added to the differential produced.

All the figures discussed above are economic loss figures, and they clearly state an uncompensated economic loss, in 1967, of at least \$5 billion. The substantial increase in medical expenses and in wage levels since 1967 would mean the present loss is substantially greater, but I have no way of knowing whether the percentage of tort recovery is higher in 1971 so I have used the 1967 figures throughout for consistency in the base for all comparisons.

In order to determine how many premium dollars it would take to pay (or properly reserve) \$5 billion, it is necessary to make an assumption as to the efficiency of the insurance paying system. I assumed a maximum efficiency under "No-Fault" of 40% expense and 60% payout. I do appreciate that there are optimistic predictions of a higher percentage of pay-out, but all insurance company experience denies the probability of a higher payout. I have pointed out the Hart Committee 10 year study which showed payout in *Collision Insurance*, which is first party no-fault insurance, of only 54%. I note also that the private insurance industry has a general payout of 65% in Workmen's Compensation insurance. However, this is group insurance where the sale is made to the employer, where the employer pays the premium with minimum handling cost, and where the employer does most of the work in investigating and reporting claims. If the Workmen's Compensation system required every employee to purchase his own health and accident policy before he could be allowed to go to work, the selling and administrative cost would be much greater. If the insurer had to do all the investigating and paper work on claims, the expense would be substantially increased. An additional 5% for sales expense and administrative expense seems conservative.

If insurance company payout is 60%, then it will take \$8.34 billion to pay out \$5 in additional, presently uncompensated losses.

You may well say that the present level of tort recovery is stated in "net" figures after guessed-at attorney fees. On this point, the "Economic Consequences" study said at page 48 that legal costs amounted to 25% under the tort system, on the average. If total recovery was \$877 million net, as my calculation shows, which is higher than the \$813 million stated by Senator Hart, then the gross recovery was \$1.17 billion and fees were only \$293 million. There will certainly be many disputes over extent of loss, extent of injury, extent of continuing disability, extent of survivor's loss, and similar disputes over a \$5 billion payout. Fees of \$293 million would be only about 6% of that payout.

In any event, this level of fees would not change the result. Assume loss of \$6.1 billion, less payment of \$1.17 billion gross or \$877 million net, and it would still take well over \$8 billion to pay the uncompensated loss at 1967 levels. It would take more than that with intervening inflation in medical costs and wages, even if the industry reaches that 60% payout level they have not yet attained on their first party automobile coverages.

You ask what the present premium level is for bodily injury coverage, but I respectfully suggest that you must compare the 1967 premium level to the 1967 loss level. The total net premiums written for bodily injury coverage in 1967 were, according to "Best's Aggregates and Averages", \$4.6 billion. Note that even with a 60% efficiency in 1967 that would only pay \$2.76 billion gross in losses, and the D.O.T. final report "Motor Vehicle Crash Losses" says at Table 2, Page 6, that compensable economic loss for all victims, in 1967, for medical expense, wage loss alone, excluding other expense and property damage, was \$5.48 billion.

Unless those D.O.T. figures have been deliberately exaggerated—which I cannot believe—then clearly it will take twice the bodily injury premium level to pay full benefits for economic loss excluding property damage even if attorney fees are reduced to zero and no compensation whatever is paid for economic loss.

You ask: "What is the present deficiency in the tort liability system?" In the context of your questions I must assume this is a typing error and you meant to ask about the present efficiency of the tort system. There is no information available to me which would permit an answer if by "present" performance you mean 1970 or 1971. The last figures I have were from the Hart Committee hearings which showed a ratio of "claims paid and outstanding" of 60% and expense of 40% for the stock companies, national totals, and a ratio close to that for the mutuals. However, the stock companies claimed substantial underwriting losses occurred in that year. I would suppose that in years in which an underwriting profit is earned at the levels the industry wants (5% on premiums in addition to the investment profit) then the payout efficiency drops.

You ask about "present" premium levels for bodily injury coverage. The "Insurance Information Institute" says that bodily injury premiums written increased from \$4.6 billion in 1967 to \$4.9 billion in 1968 to \$5.4 billion in 1969 and to \$6.1 billion in 1970. However, the 1970 figure is said to be an estimate; and I do not know whether the Bodily Injury number includes Medical Pay and Uninsured Motorist. Economic losses have increased at a similar rate, according to the Institute.

Question No. 2: In your testimony you said that the collision insurance system is "no-fault-first-party-don't-investigate-primary-liability." Is the collision insurer under the present system subrogated to any liability action that the policyholder might have? If so, how is this coverage analogous to the coverage provided in the "qualified no-fault policy" specified in Committee Print One of S.945?

Answer to Question No. 2: Collision insurance is no-fault first party insurance. The collision insurer today is subrogated. I would hope that with intercompany arbitration the amounts the company recovers on subrogation claims from other insurers at least equals the cost of processing the subrogation claim. If so, I stand on my statement that collision insurance payout efficiency does not promise great payout efficiency under S. 945, where as presently written none of the claims payment losses can be recaptured by subrogation.

Question No. 3: In your testimony you say that "the truck imposes much higher injuries when it is at fault". Are the injuries resulting from a collision between a truck and a car necessarily any less severe when the truck driver is not at fault?

Answer to Question No. 3: You are quite right in questioning my statement about the truck imposing "much higher injuries when it is at fault". The statement is an elision. I meant to say that the truck imposes much higher injuries when it is at fault than the private passenger car does. I have corrected the transcript accordingly, so that it will make the meaning clear. You will note that I was comparing premium costs. The devastating injuries that at-fault heavy trucks impose, compared with an at-fault private automobile, accounts for the much higher premium charged against heavy trucks. The injury and fatality rate in car-truck collisions is, I would suppose, the same regardless which is at fault. However, under No-Fault, S. 945 will make the trucking company responsible only for the truck driver's injuries, which gives a windfall to the trucker and means higher premiums for the private automobile driver.

Question No. 4: In your testimony, you state categorically that the youthful driver will pay the low rate. Why is this so, if as you say, he has a high risk of loss and under Committee Print One he has a high loss potential because future anticipated scrapes are paid?

Answer to Question No. 4. In the transcript I discussed the shifting of classes under No-Fault. The unmarried 17 year old male, without driver training, will of course pay a low rate under No-Fault plans since he is presumably a student unemployed, with no dependents. He presents no risk in a fatality case. He presents no risk of wage loss unless he suffers permanent disability, and permanent disability cases are very rare, as you know. He will not have the debilitating diseases of the older driver—coronary artery disease, arthritis, bone embrittlement and impaired blood supply—which may make moderate impact seriously disabling. The young driver should, under S. 945 get "a low rate," as I said in comparing the two systems. You seem to suggest that I believe the young driver

will get the lowest rate of all. I am not sure of that, and did not so testify, but he certainly will get "a low rate" compared to the present system, as I testified. The testimony offered on behalf of the American Mutual Insurance Alliance supports this view, as I read it.

Question No. 5: In your prepared testimony you state: "it is difficult to understand why those who pay nothing in premiums are treated so much more generously than those who pay the full bill for the benefits they get." Suppose the following situation under the present system. Suppose uninsured motorist A is hit by negligent motorist B who carries liability insurance. Uninsured motorist A can recover from motorist B for the loss which motorist B caused motorist A. Conversely, suppose insured motorist B is hit by motorist A. Unless A has sufficient resources, B gets nothing from A because he is not insured. Under recent Supreme Court decision, A can not even be denied his driving privileges if he obtains a discharge in bankruptcy for any unsatisfied judgment which B obtains against A. B's only recourse is to look to his own insurer if he has uninsured motorist protection. Under the present system, then aren't drivers who pay nothing for premiums treated more generously than those who pay the full bill for the benefits they get? Doesn't Committee Print No. 1 treat non-car owners the same way the present insurance/liability system treats them?

Answer to Question No. 5: Under the present system, uninsured motorist A can recover in full for his losses if he is injured by negligent and well insured motorist B. In this case, he is treated to full benefits without paying premiums. However, if the accident is the fault of uninsured motorist A under your example, then he recovers nothing at all, and is not treated "more generously" than premium payers. Under Committee Print No. 1, the pedestrian who walks out from between automobiles in midblock at night, and is killed when completely at fault, is nevertheless treated to full compensation for all loss without limit and for all general damages if he is a non-payer of premiums or a dependent of a non-payer. This is entirely different from the way the present insurance/liability system treats him.

Under the present liability and insurance system, the negligent driver even though uninsured is liable to the full extent of his assets and will have to be wiped out in bankruptcy to escape liability. He does bear a risk of loss. The non-owner class under Committee Print No. 1 bears no risk at all. When you substitute a health and accident, first-party, insurance system it seems odd that the first party beneficiary who draws the highest benefits of all pays nothing and recovers regardless of personal fault in causing the injury.

Question No. 6: In your testimony you asked the question: "Do lawyers take too much?" But you never told the Committee how much in fact lawyers take? How much of the current premium dollar finds its way into the pockets of lawyers? How much of that money is paid to the plaintiff's attorney? How much is paid to the defendant's attorney? What percentage of its total income does the legal profession derive from auto insurance dispute settlement?

Answer to Question No. 6: I don't think lawyers take "too much," because the people who need the lawyer's help to fight the insurance industry are not generally complaining about the cost of the lawyer—and about 60% of claimants don't hire a lawyer anyway.

I do not know of any valid statistical study which can state how much of the total premium dollar lawyers earn. The D.O.T. study on Auto Accident Litigation said that in litigated cases the fee for the claimant averaged 35.2% of the recovery, but it was assumed that only 220,000 cases were filed out of 4,400,000 accident victims, and the questionnaire for the fee study was sent to a very small sample. The estimate of fees was based on only 389 questionnaires, which you must agree is a mighty small sample on which to predict fees for over 4 million injured persons, most of whom never hire a lawyer.

The Hart Committee Chart on "Where The Premium Went" in a past decade said that claimants' lawyers earned \$5 billion in the 10 year period, but that number is itself just a guess at it. (The same chart does state that lawyers for the claimants receive less than half as much in total as agent's sales commissions).

The American Bar Foundation did a study called "Contingent Fees for Legal Services" which would support a conclusion that lawyers might derive 15% of their income from contingent fee injury cases, depending on where they practice. However, I assume your question refers to automobile cases, and any estimate of large incomes from trial practice generally must recognize that air

crash cases, railroad cases, admiralty cases, product liability cases, malpractice cases, and condemnation work are all productive of contingent income. If only 17% of all court time is devoted to automobile cases, then 83% of trial practice time must be going to other types of civil litigation, and to criminal and divorce litigation. If you know how much the *total* income of the entire legal profession is, and can tell me that number, then I could hazard a guess as to the percentage derived from automobile accident disputes, and the percentage derived on business and corporate counseling, and estate work, but the estimates would have to be based on old and possibly outmoded studies.

Senator HART. The witness we shall now hear from, already referred to by Mr. Spangenberg, is Mr. Leon Wolfstone.

STATEMENT OF LEON WOLFSTONE, WASHINGTON BAR ASSOCIATION, SEATTLE, WASH.

Mr. WOLFSTONE. Preliminarily, let me state that I endorse the views expressed by Mr. Spangenberg and his written testimony as well, which I have had an opportunity to read. It is not surprising that I endorse his views since we in large part have a somewhat similar background, at least at the present time, though historically my background was preponderantly representing insurance companies in the defense of cases rather than the plaintiff side as is more often the case today.

I agree wholeheartedly that there must be major reforms—major reforms. It is my thought, however, that the reforms should be within the tort system rather than the wholesale turning upside down of the system and the institution of a no-fault concept. I should explain preliminarily as I have in my written testimony, which I trust will be in the record, that I appear here in a dual capacity. I am a member of the Auto Reparations Committee of the Washington State Bar Association, and on their behalf I speak only to the subject of the proposed Senate bill and the question of the timeliness of proceeding on it at this time.

My views as to the merits and as to other phases are not on behalf of the Washington State Bar Association, but are the personal views of myself.

I will abbreviate as much as I can insofar as the material appears in the written testimony. Some years ago, in 1956, I addressed myself to the problem of increasing the availability of the insurance premium funds to the injured victim and bringing about improvements and reforms so that the insurance system as well as the tort system would work better.

At that time I pointed out that the liability carriers would be well advised to recognize that which they generally speaking refuse to recognize, namely, that they are a quasi-public utility, that they are vested with a public obligation.

In appearances on this subject before other legislative groups, I have heard the statement made by Mr. Victor Slevin of the AIA that the insurance system as it presently exists is not designed to compensate the innocent victim, it is designed solely and exclusively for the purpose of protecting the assets of the wrongdoer.

With that statement I disagree and with that statement I will always disagree. It is my concept that the justification of the insurance industry carries with it the concept that the industry receives the public's

funds in the sense of a trust, a fiduciary, that the industry has an obligation, promptly and with dispatch and with fairness, to investigate cases and arrive as speedily as liability and damages can be determined on a prompt, fair, and just settlement of the claims.

I disavow the concept that the sole concern is to protect the assets of the insured if he is found to be at fault. I lean heavily on the concept that there is this duty to the public, and I lean heavily on the fact that the carriers do not discharge that duty as they should.

In 1956 I urged that time before the claims managers' meeting that carriers undertake voluntary pay in the clear liability or probable liability cases, the voluntary method that we see today, the voluntary economic loss that we see today. I encouraged that be done both in the discharge of their public duty as well as in the benefit of the industry, pointing out in many instances people's conditions worsened on a psychological overlay basis because of the protracted delay, the drawn-out time, the pressure of bills to be paid, and indeed their conditions worsened and ultimately there was a requirement that a greater amount be paid.

At that time I also urged that the companies indulge in what is called open end settlements. If any are not familiar with the term, it is a settlement made on the basis of a portion of the claim but leaving other items in limbo for the future.

This is done in variability. For instance, one can provide that the matter of a back surgery is left open. Should it occur, an additional amount will be negotiated and paid. It can be spelled out, paid up to a certain amount and within time limitations. The suggestions I made were found to be unacceptable to the liability insurance carriers as proven by the fact that within a matter of some 60 days, about three-fourths of the carriers I represented advised me that there would no longer be the need of my services.

However, today the same carriers are making advance payments and are making open-end set limits. I speak today of advance pay and open-end limits from the standpoint of being a means of reducing cost to the system and making more funds available.

It is my information that the companies that are indulging in these voluntary pay programs and open-end set limits are finding a sharp drop, a marked reduction in the frequency of litigated cases, that the body public feels that they have been dealt with promptly and fairly and justly and in many instances they totally waive on a voluntary basis the right to recover for pain and suffering or the intangibles.

The suggestion has been made to eliminate the lawyers from the system, and much will be accomplished. I suggest to you that the best way to eliminate the lawyers from the system is to deal with the innocent victim promptly, fairly and justly, so he does not need a lawyer.

It is only when they feel they are not being so treated that they feel the need of a lawyer. I would say to you, gentlemen, and I have said before that if the no-fault concept is, in fact, good for the public, the lawyers of the Nation should stand up and urge its adoption without regard to whether it is good or bad for the lawyers.

Conversely, I say that the fact that it may be good for the lawyers does not justify a change. The fact that it is bad for the lawyers should not enter into the consideration. The objective is what is in the public's welfare.

crash cases, railroad cases, admiralty cases, product liability cases, malpractice cases, and condemnation work are all productive of contingent income. If only 17% of all court time is devoted to automobile cases, then 83% of trial practice time must be going to other types of civil litigation, and to criminal and divorce litigation. If you know how much the *total* income of the entire legal profession is, and can tell me that number, then I could hazard a guess as to the percentage derived from automobile accident disputes, and the percentage derived on business and corporate counseling, and estate work, but the estimates would have to be based on old and possibly outmoded studies.

I encouraged that be done both in the discharge of their public duty as well as in the benefit of the industry, pointing out in many instances people's conditions worsened on a psychological overlay basis because of the protracted delay, the drawn-out time, the pressure of bills to be paid, and indeed their conditions worsened and ultimately there was a requirement that a greater amount be paid.

At that time I also urged that the companies indulge in what is called open end settlements. If any are not familiar with the term, it is a settlement made on the basis of a portion of the claim but leaving other items in limbo for the future.

This is done in variability. For instance, one can provide that the matter of a back surgery is left open. Should it occur, an additional amount will be negotiated and paid. It can be spelled out, paid up to a certain amount and within time limitations. The suggestions I made were found to be unacceptable to the liability insurance carriers as proven by the fact that within a matter of some 60 days, about three-fourths of the carriers I represented advised me that there would no longer be the need of my services.

However, today the same carriers are making advance payments and are making open-end set limits. I speak today of advance pay and open-end limits from the standpoint of being a means of reducing cost to the system and making more funds available.

It is my information that the companies that are indulging in these voluntary pay programs and open-end set limits are finding a sharp drop, a marked reduction in the frequency of litigated cases, that the body public feels that they have been dealt with promptly and fairly and justly and in many instances they totally waive on a voluntary basis the right to recover for pain and suffering or the intangibles.

The suggestion has been made to eliminate the lawyers from the system, and much will be accomplished. I suggest to you that the best way to eliminate the lawyers from the system is to deal with the innocent victim promptly, fairly and justly, so he does not need a lawyer.

It is only when they feel they are not being so treated that they feel the need of a lawyer. I would say to you, gentlemen, and I have said before that if the no-fault concept is, in fact, good for the public, the lawyers of the Nation should stand up and urge its adoption without regard to whether it is good or bad for the lawyers.

Conversely, I say that the fact that it may be good for the lawyers does not justify a change. The fact that it is bad for the lawyers should not enter into the consideration. The objective is what is in the public's welfare.

On the other hand, if it is not in the public's best interest, then, the lawyers of this country should rise up and speak opposed to the no-fault concept. Most of the reputable bar associations of the country at the national level have studied this matter in depth, and to my knowledge they have all come out uniformly opposed to the no-fault concept. This includes bar groups that are not engaged in personal injury litigation at all.

It is the responsibility of the lawyers to speak up and to speak their views even though they be accused of self-interest in so doing. I will direct myself to areas of reform within the present system that in my judgment will accomplish most of the proper goals and objectives of those who seek no-fault.

Obviously, it would be desirable if insurance premiums could be reduced. In some areas, reforms can be made that will tend to reduce the premiums. Some reforms, however, will necessitate compensating in part at least increases in premium, because if it does entail a greater payout, obviously the funds must come from the premium dollar or from other sources.

If it is decided on a sociological basis that there should be a system of payment of economic losses without regard to fault, this should be approached as a sociological and economic problem and not as a tort liability or necessarily as an insurance problem. It has been suggested that the Congress of the United States adopt a plan whereby a limited amount of economic benefits would be paid without regard to fault for a maximum period of 1 year.

The maximum amount could be \$1,000 or \$3,000 or any other given figure, preserving intact the tort system, and to prevent dual recovery requiring that if the innocent victim accomplishes a tort recovery, he reimburse to this fund for the economic benefits that he has enjoyed by drawing down at the early stages.

It has been suggested that there could be an insurance-operated plan or it could be a governmentally operated plan, whether by social security or whatnot. It has been suggested it could be funded by a very modest gasoline tax. That would take care of the sociological problem of making economic compensation available to the tort victim.

Within the framework of the present system, there is a great deal of emphasis on the statistics produced by the DOT and others. We live in a statistic-minded binge era, and there is a great risk of relying too heavily upon statistics without recognizing that there may be various interpretations and conclusions drawn. I am reminded some years ago of attending a program on accident prevention, a highly statistically oriented group, to the point of ad nauseam. I informed the chairman of the meeting that I was aware of a statistic to the effect that in motor vehicle accidents, some 98.72 percent of the vehicles involved had a spare tire in the trunk.

The dean of the college of the university conducting the program was very much impressed. He said, "Visualize that, this demonstrates my point, people have a spare tire, they are careless, they are inattentive, they are overly bold, it is a great statistic of overimportance."

I then confided to him and those in attendance that the statistic I quoted was dreamed up at the spur of the moment and it was not on a sound statistical basis or any research. The dean said that is of

no matter, it is the principle behind it. People are too cocky when they have a spare tire. "We must devote our time to searching statistics relating to the frequency of accidents and the presence of spare tires," he said.

Many of the conclusions drawn from the DOT statistics are equally absurd. Dual contradictory interpretations can be developed, as pointed out by Mr. Spangenberg in his testimony.

And area that can achieve great savings and improved efficiency deals with that of standards of safety in automobiles. We have heard mention this morning of the drunk driver, and I deplore him and I criticize him. Certainly, our licensing laws should be more strictly enforced and suspensions and revocations mandated in cases of a serious and repeater defendant.

I think that should be done. However, it is distressing to me that the statistic-minded rely on the fact that someone had been drinking, ergo, the drinking caused the accident, when in truth and in fact in many instances, it caused, was caused by built-in obsolescence of the tailpipe, exhaust, manifold system of the car, producing carbon monoxide in the car and disabling the driver.

No statistics are found on that. I have heard Secretary Volpe of the DOT was making a study in that field. The cost for your leak-free exhaust manifold system would be about \$9 per car and would last forever rather than the built-in obsolescence necessitating the replacement of one or the other or all three of the systems within a matter of months with no warning whatsoever to the driving public.

This would be meaningful reduction of the accident toll. I need not go into the bumper safety approaches. That has been touched upon in written testimony, and you are fully familiar with that. There are many reforms within the present system that can make it work, and throwing it out because it does not work as well as it should is not a proper approach.

I will touch upon a number of these. Certainly, I would encourage the institution of a system of comparative fault for contributory negligence as has been recommended by every major bar association. Which plan?

The ABA has recommended the Wisconsin plan which has since been amended. Others have urged the Mississippi or FELA plan of true comparative fault. Still others have urged the Maine-New Hampshire plan where you may recover if your negligence is not greater than that of the other party.

This will bring about a greater measure of equity in the handling of the tort victim.

As an aside and not in continuity, I call to your attention the recent publication by Prof. Jeffrey O'Connell, a book to be published, called "The Injury Industry."

The advance sales pamphlets are entitled, "No-Fault—Boon or Bane?" Though I would not agree with Professor O'Connell's conclusions, I think the title is prophetic, and I think too often we have overlooked the fact that the no-fault approach may be a bane; I think we have overlooked the fact that the public has been misled into thinking that the no-fault approach is a panacea, and thereby they have been defrauded and members of the press have been defrauded into en-

dorsing an ill-informed or an inadequately informed basis the no-fault concepts.

I am compelled to tell you that when Mr. Victor Slevin, spokesman of the American Insurance Association, in a recent appearance in Seattle some 2 or 3 weeks ago in hearings conducted by the Insurance Commissioner of Washington on the study of no-fault approaches was asked by the legal counsel for the Legislative Interim Study Committee, "Mr. Slevin, where will the additional funds be obtained that obviously will be necessary if you are going to pay out more money on a no-fault basis to everybody?" in a Freudian slip, Mr. Slevin said, "By underpaying the innocent victims." Therein lies the proof.

It has been pointed out time and again that the no-fault concept imposes a victim tax on the innocent victim in order to provide funds for those who are indeed at fault. Many of the no-fault concepts, and note they are usually referred to as plans, are indeed a fraud upon the public because they are oversold, with representations as to how they will function that are untrue, in fact, and are incomplete. In one meeting that I attended was where there was a discussion of the elimination of pain and suffering, this meeting of some 300 ladies, I asked for a show of hands as to how many were in favor of eliminating the pain and suffering claim of the person they hit, and there was a goodly show of hands.

I then asked, how many were in favor of eliminating their right to pain and suffering if they were the innocent victim and wrongfully hit by the other? Total absence of hands.

I must concede to you that some of the changes that I shall propose to you may result in an increase in premium. I have the feeling, however, that if the American public is told truthfully, frankly, and fully that they will have a better program of compensation and that it will cost them slightly more, that they would be willing to pay this increase as long as it is a justified increase.

I think in terms of the Oregon plan, with which I am sure the distinguished Senators are familiar, in the State of Oregon they adopted legislation in the last session requiring on a State level that all liability policies have a provision for first party medical coverage on a no-fault basis and limited first-party economic loss from wages on a no-fault basis. The legislative package also provided for the substitution of comparative negligence and a full continuation of the tort system as it now exists.

Copy of the Oregon package is attached as an exhibit.

Keeping in mind the charge of the DOT that we should observe carefully what the results are of the diverse systems adopted in the various States, I am most anxious to observe the effect of the Oregon system. I am most anxious to observe whether there is a sharp decrease in the tort claims because people are paid their economic losses for wage loss and medical expense on a limited basis. I think there will be a great drop in the number of claims. My opinion is there will be some increase in premium on a temporary basis, but hopefully enough of a drop in the claims so that that increase will be on a temporary basis only.

There are no presently solid statistics from which we can compute realistically in my judgment the increased premium cost of a total switch to no-fault, whether it be under your Print No. 1 or under any

one of the other—I understand there are now 153 varieties of no-fault concepts that have been offered, most of which I candidly call frauds and hoaxes. But there is no statistical basis for which we can determine sensibly at this time what the impact will be upon the premium, and the public is misled into believing that there will be a reduction of premium.

It would appear obvious that if we have safety in automobiles that lessens the severity and frequency of injury and death, the payout will be less; and there are many phases of safety. If you feel you drive a safe automobile, I invite you, as you leave this afternoon, to put your hand over your head, whether you are in the front seat or the back seat of anything but a convertible, and you will find a channel bar strategically placed above your head which, if perchance by reason of an accident, you bounce upward, is conveniently placed to insure the cleavage of your head. The cost for padding that is nine cents per car, padding both the back and front seats. There is carbon monoxide, the safety harnesses, the air bags—we are all familiar with these. These should reduce the frequency and severity of injury, and accordingly, reduce the amount of claims to be taken.

Other savings that I would urge upon you: The use of a less than 12-man jury on an optional basis—a 6-person jury. Cut down the time of the trial, the voir dire and the deliberation time. Cut down the economic cost whether it is paid by the premium dollar or the tax dollar as the case may be. It will permit a greater service by the public and greater quantities to serve, because you will have twice the number of people roughly available to serve, and they can serve lesser periods of time.

Make available insurance limit information now available routinely in the Federal courts. It is felt and urged strongly by many and certainly in the Federal writings that this increases the probability of settlement, lessens the legal expense to the plaintiff and the defense alike. It has been suggested that interest be allowed to the tort victim from the date of the injury or from the date of the filing to sue. Why? It would appear at first blush this would increase the payout. But I submit to you if the interest is paid and required to be paid, it would eliminate the dilatoriness on the part of the perennial defendants and the increasing of the severity of the injury on a psychological basis during this period of protracted delay.

I would commend to you the reappraisal of the collateral source rule to prevent duplication and multiple benefits except when a premium has been paid either in money, services, or the relinquishment of rights. As to that, I call your attention to the fact that if you carry five policies of life insurance with five companies and pay five premiums, you do collect from all five. If you paid for what is called collateral sources, you should be entitled to them.

I join with Mr. Spangenberg's remark that the public outcry with regard to liability insurance system functioning deals largely with arbitrary cancellations, outrageous delays, and outrageous rating practices. These can be corrected within the framework of the present system. These are areas of proper legislative concern to the Congress. Clarification and uniformity of policy provisions would lessen litigation. The multitude of conflicting and contradictory provisions dealing

with excess coverage, primary, concurrent, duplicative, and overlapping coverages, we can eliminate a lot of that litigation by a proper requirement of uniform provisions.

Strict enforcement of license suspension and revocation is a must, and certainly there may be a revocation for the repeat offenders and the serious offenders.

Uniformity of adequate licensing standards will assure a better quality driver.

Mandatory liability insurance in adequate limits, not the 5-and-10, should be required. In some States taxicabs are required to have 5-and-10, whereas the body public are required to have 15-and-30. The body public is entitled to uninsured motorist coverage. Taxicabs were not required to carry uninsured motorist coverage. Many passengers ride cabs exclusively and have no cars of their own. These people are entitled to and should be protected.

When we speak of mandatory insurance, we are faced with the argument it is too expensive to police. I would commend to you the thought that the mandatory liability insurance be geared to the license plates rather than to the operator's license.

I would commend to you a study of a system whereby the liability insurance carrier would be provided color-coded stickers to put on the license plates at intervals, whether it be 60 days or quarterly, and if the premium is paid, those stickers are mailed, and if the coverage is canceled, they are returned to the licensing department of the State. Much easier to enforce at lower cost than geared to the motor vehicle operator's license and much easier to detect the violator.

Some reference has been made here to the contingent fees. I suggest that all fees now are and properly are subject to court review, plaintiff fees, and defense fees alike are subject to court review and prohibition of abuse. I think many of these reforms that I have touched on here today and others that are in my formal paper are matters of proper congressional legislative action.

Obviously, it is desirable that there be uniformity of the laws of the States, but uniformity at the price of bad laws is not desirable. When I spoke on this subject before the Alaskan legislative study group, composed of eight committees, at the end of the session the chairman of the committee announced to everyone there, the participants and the persons testifying:

It appears obvious to us that the various no-fault concepts are uniformly bad in variable degree, but the public is desirous of no-fault. They don't understand it, but they want it. So let's give it to them even though we know it is no good.

That is not a sound legislative approach. I would hope that they do not do that in Alaska.

I would hope that on a State-by-State basis a very careful evaluation will be made of the needs of the individual States, and the needs do differ from State to State. In my State, we have no big court delay. In most of the counties of our State, you can have a trial within 3 months. Usually it is too soon, because the facts as to the injury have not been established to determine intelligently the severity of the injury and the problems to be encountered.

The beneficiaries of these no-fault concepts in large part, if not entirely—well, I should only say in large part—will be increased

profits to the insurance industry, a shifting of which companies write the business, and lowered premiums for the bad driver at the expense of higher premiums for the good driver. I would hope as an outgrowth of your studies, efforts will be made to see that the public is more adequately informed and correctly informed as to the consequences of these various no-fault plans, programs, schemes, hoaxes, or whatever they may be.

I favor very much the DOT's suggestion that we try the no-fault approach in medical expense. I am sympathetic to the Oregon approach of having that available on a mandatory basis as well for a limited income loss from wages. I think that makes sense, and it may be a matter of proper congressional legislation as well. I have suggested earlier the substitution of the doctrine of comparative negligence or comparative fault. I am assured by spokesmen within the insurance industry that in the States that switched from contributory negligence to comparative negligence, there was no increase in the amount paid out by the industry. True, some were paid who otherwise would not have been paid, but the fact of the matter was that most were paid less than they would have been paid if they were completely innocent under comparative negligence, because of the threat, the always possibility that a jury would assess a minimal amount—5 percent, 10 percent—and reduce the award accordingly.

It has been pointed out the insurance industry is not a charity. I think the gentleman with the St. Paul Mercury Insurance Co. said it right, "You know, we are not really the St. Vincent de Paul." He is right. The insurance industry serves and can serve a valuable function. Its justification for existence is their asserted expertise in evaluating risk and providing an actuarially computed basis to spread the risk on a sound basis.

The insurance spokesmen who now espouse no-fault are saying simply, we oversold. We are not all that expert. Let's try a different system at the expense of the innocent victim to assure us greater profitability in the operation of the insurance system.

The reforms I have mentioned and many others can bring about reduction in costs. Some will bring about an increase in cost. But properly explained, I feel that the American public is in the mood and position that if they are told you are now going to get a 22 ounce loaf of bread instead of a 16-ounce loaf, and it is going to cost you X cents more per loaf, that they will pay it. Their outcry is not against the tort system, but of the inadequacies and abuses of the insurance system as it is presently constituted and operated.

The insurance system has opposed these reforms historically whether it be the comparative negligence or any of the others, and there are many others. They have opposed them, and I think now is the time for them to join in the public outcry and bring about these reforms so there will indeed be a system to provide prompt, fair, and just compensation to the innocent victim and a program of fair evaluation of fault where the fault is on the part of the plaintiff as well as one or more of the defendants.

I think that will conclude my oral remarks.

Senator HART. Thank you for your highlighting of the prepared testimony. I shall order the prepared testimony be printed in the record in full.

Mr. WOLFSTONE. It has been a pleasure to be here.

Senator HART. The chairman of the committee, Senator Magnuson, wanted very much to be here when you testified.

Mr. WOLFSTONE. He had to get down to Florida. He had top-priority business. I discussed it with him.

(The statement follows:)

STATEMENT OF LEON L. WOLFSTONE

Preliminarily it should be stated clearly that my appearance before this Committee is in a dual role.

Dealing solely with the question of whether or not action should be taken at this time on Senate Bill 945 or similar legislation I appear upon behalf of the Washington State Bar Association Committee on Automobile Reparations, of which I am a member.

Remarks dealing with other phases and subjects are not to be deemed made upon behalf of the Automobile Reparations Committee of the Washington State Bar Association but rather shall be deemed to be made in a personal capacity.

By way of background I have been engaged in the private practice of law since 1939. Until about fifteen years ago my practice in the personal injury field was in large part on behalf of liability insurance carriers as distinct from representing persons asserting claims by reason of injury or death of the auto accident victim. During that period of time I was designated counsel for dozens of insurance companies, stock companies and mutuals alike.

In subsequent years the practice has shifted so that I now in very large extent represent those asserting claims by reason of injuries to or death of auto accident victims so far as concerns the personal injury practice. An additional activity in recent years would include representing the insured in matters of conflict of interest or questions involving coverage. This would include the panorama of protecting the insured from needless risk of judgment in excess of coverage by way of taking effective steps to assure the prompt and fair settlement of claims within liability limits in order to eliminate the personal risk to the insured. Similarly where a liability insurance company has issued a notice of reservation of rights of disclaimer of coverage I have been engaged extensively upon behalf of the insured, both in dealing with third party claims against him and in his relationship to and with the liability insurance carrier.

Additional relevant background information would include the fact that I am a former President of: Americal Trial Lawyers Association, Western Trial Lawyers Association, and Washington State Trial Lawyers Association. I am an active member of the Washington State Bar Association's Committee on Auto Reparations, and the counterpart committee of the Seattle-King County Bar Association, as well as a member of the American Bar Association Committee to Achieve Justice through the Adversary System. I serve on divers committees of the Insurance, Negligence and Compensation Section of the American Bar Association and have served on many committees on behalf of the Washington State Bar Association and the Seattle-King County Bar Association.

Let me deal first with the initial assignment, namely that of the issue as to whether or not the Congress should at this time proceed with the adoption of Senate Bill 945 or similar legislation that in full or in part eliminates or limits the tort system of recovery of full, fair and just damages based upon fault and the substitution of one or another of the dozens of first party no fault coverage approaches. It is imperative to recognize and recall that the Department of Transportation and other officials of the United States government in urging the no fault approach have emphasized that this should be done on a state by state basis rather than on the basis of national legislation. Indeed, the Commissioners on Uniform Legislation have been commissioned to draft a recommended "Uniform Bill" to be in turn recommended for consideration by the fifty states. It should be clearly understood that the assignment undertaken by the Commissioners excludes consideration as to the desirability and need of substitution of a no fault approach for the traditional fault approach, or a combination of the fault approach with substantial reformation within the existing tort system. Be that as it may the Commissioners have undertaken the assignment, have met from time to time, and will before long, be reporting their recommendations within the limitations of the assignment made and assumed.

Certainly the legislatures of the various states will need time to critically examine and evaluate the recommended bill of the Commissioners as well as to consider the underlying aspects as to what changes, if any, are desirable and should be made. It is to that end that various legislatures have been holding hearings and conducting studies for the past several years. It is to that additionally that many more legislative committees are presently conducting such studies on an interim basis and have assigned committees to make appropriate study, evaluation and report as has the Washington State Bar Association and the Seattle-King County Bar Association. It would seem to be premature, on the one hand, to urge and encourage such studies to be made on a state by state basis, and to then nonetheless preempt the field by federal legislation that would supersede state legislation and policy decisions.

There can be no doubt but what the existing tort system and liability insurance system have not functioned as fully, fairly and justly as they should have. Necessarily, however, the approach should be a balanced approach of determining the urgency of the total change to no fault as compared to a careful analysis of changes that may be made within the existing tort system. It is strongly and sincerely urged by many that there are a number of changes that should be carefully considered and fully evaluated which will tend to bring about a system that preserves the fault concept and nonetheless brings about a more efficient and fairer disposition of such claims within the framework of the existing third party liability insurance.

It is strongly urged that hasty action abolishing the fault concept and substituting the no fault concept is ill-advised and certainly unwarranted so far as concerns depriving the states of the opportunity to proceed on a state by state basis.

Admittedly concern is felt with some justification that some measure of unhappiness or inadequacy would result from the state by state approach because of the variability of plans adopted and decisions made. It is urged, however, that uniformity at the expense of full, fair deliberation and opportunity to act on a state by state basis is not at this time called for nor desirable. It is accordingly urged that the Senate and the House of Representatives delay taking any action that would preempt the field and preclude an opportunity for state by state examination of the problems and appropriate action.

The one thing that does appear certain from the extended studies and controversies regarding the no fault proposals is the fact that the "systems" work better in some states than in others, and that many reforms of the traditional system are needed everywhere, whereas some different ones may be needed from state to state, or not at all.

I will deal next on a limited basis with the question of the desirability or lack of desirability of substituting the no fault approach for the traditional fault approach.

In the interest of brevity I incorporate by reference the testimony of Craig Spangenberg given before this Committee on a prior occasion, as well as that to be given or given in connection with these immediate hearings. In other words, recognizing the fact that I agree with and concur with the views of Mr. Spangenberg I deem it so far as his views are concerned, sufficient to say this rather than repeat his views.

However, going somewhat beyond it in somewhat different directions from the testimony of Mr. Spangenberg, I believe that those spokesmen of the insurance industry that state that liability insurers have only a responsibility to protect the assets of their insured from claims of auto victims are inaccurate and speak in a mid-Victorian frame of reference. One need consider only recent decisions dealing with the liability of such insurers to make prompt evaluation and good faith settlements within limits to realize that the courts of America quite uniformly now hold that the liability insurers owe a duty to the body public and in particular the tort victim as well as a duty to the wrong-doer to protect his assets. Similarly the recent cases dealing with efforts to invoke by way of reservation of rights or disclaimer of coverage, positions that would permit the carrier to escape responsibility for the payment of a claim or judgment because of conduct of the insured recognize that there is a strong public interest and public obligation involved. It is for that reason that time and again courts have ruled firmly, clearly and almost uniformly that the companies cannot assert such rights to disclaim coverage or invoke reservation of rights if such conduct serves to deprive the victim of access to the insurance proceeds for the payment of a just claim.

Many, if not most, of the Insurance Codes of the various states in one form or another refer to the insurance industry as being one that involves a public interest. The very fact that systems exist that permit rate adjustments, when fully justified, in order to recoup prior losses and to permit profitable operation, demonstrate the quasi-public utility nature of the industry.

To demonstrate the consistency of my views, see attached Exhibit A, published in May of 1956. The speech from which the exhibit is excerpted also dealt with the wisdom from the company's standpoint and the desirability from the public's standpoint of advance payments and open-ended settlements.

Without conceding in the slightest the validity of the views and conclusions of Professor Jeffrey O'Connell, in his announced book entitled "The Injury Industry", I am nonetheless very much intrigued with the question posed by the advance sale promotional material entitled "NO FAULT—BOON OR BANE?"

There is little doubt but what Professor O'Connell would consider no fault insurance to be a boon. There is equally no doubt that many other equally well-informed persons consider it to be a bane. Some of the reasons for that view have been and will be expressed by Mr. Spangenberg in his testimony, and by others as well as myself.

In considering the boon or bane question, I am reminded of the Freudian slip of one of the articulate spokesmen of the American Insurance Association, W. Victor Slevin, in his recent appearance at the hearings conducted by the Insurance Commissioner of the State of Washington at the University of Washington in Seattle. When asked by the counsel of the Legislative Interim Study Committee (substantial numbers of whom were present) as to what would be the source by providing the obviously necessary greater funds to pay all auto accident victims on a no fault basis, Mr. Slevin spontaneously answered in substance, "By underpaying other victims." In that Freudian slip, it is respectfully suggested that an issue of truth came to the light of day.

Numerous persons in speaking in opposition to the no fault approach have pointed out that it amounts to an auto accident victim tax.

It is to be noted that I have refrained in my testimony from referring to these no fault approaches as being no fault plans. By way of explanation it is my feeling and my assertion that the public has been deluded and defrauded into believing that the no fault approach is a boon by attaching the word "plan".

There is very little that can be accomplished by the no fault approach but what can equally well and more fairly and justly be accomplished by preservation of the fault concept and the adoption of various reforms of the tort system—provided that the insurance carriers are willing to recognize their obligation to make a fair, just settlement of claims as soon as liability and damages can be reasonably determined.

The proponents of no fault assert that there will be speedier payment of economic losses as well as a sharp reduction in the number of liability claims asserted. The experiments conducted with making of advance payments of economic losses in the clear liability and probable liability cases have confirmed that a great many of the lesser injured persons will indeed be satisfied and not assert a claim for the "intangibles" to which they are nonetheless legally and morally entitled. This strongly persuades that a further and fairer extension of voluntary advance payments will be productive of reducing the economic burden of the liability insurance company in at least these classes of claims. Similarly, persons who have been offered the availability of "open end" settlements in one or another form have been inclined to feel that they have been dealt with fairly and often do not assert their claim for the intangibles and/or make mutually agreeable settlements.

The proponents of no fault who violently asserted the desirability and need of eliminating the use of attorneys by injured clients totally overlook the fact that if the carriers will in fact and in good faith make prompt and fair settlements in keeping with liability and damages, there would be less occasion and far less need of the public to obtain the services of an attorney.

It goes without saying and should be recognized by all that if the no fault approach is in truth and in fact in the best interest of the public it should be adopted whether on a state by state or federal level without regard to the question of whether it would be harmful and detrimental to the legal profession. Conversely, if the no fault approach is not in the best interest of the public it should be vigorously opposed regardless of whether or not that opposition

is of benefit to or detriment to the legal profession. The legal profession should be called upon to make appropriate studies and research, and after careful analysis to render its opinion and report as to where the public interest lies, and as to where and to what extent there exists in the zealotry of the proponents of no fault, fraud, exaggeration and distortion.

One of the areas that is most productive of fraud, exaggeration and distortion is utilization of so-called statistical studies which—no matter how accurate or how broad or how limited—are no better than the validity of the conclusions drawn from the studies. Illustratively, some years ago when I had occasion to work with a group studying accident prevention that was extremely statistic oriented, I stated with tongue in cheek that statistics disclosed that in 98.71% of the motor vehicle accidents, one or all of the cars involved had a spare tire in its trunk. The distinguished academician who was conducting the study glommed onto the statistic with all the zealotry of some of the no fault proponents, expounding that this obviously demonstrated the fact that drivers of motor vehicles equipped with spare tires were less attentive, bolder, and more inclined to be transgressors because of the confidence they felt by the presence of the spare tire. When I publically admitted that the statistic I had offered as a figment of imagination and was offered solely to point out the irrational enthusiasm for statistical approach without regard to the soundness of the conclusions drawn, to my amazement "the Dean" said the statistics didn't matter, rather it was the philosophy behind the conclusion and that in truth and in fact it should be assumed that persons driving cars equipped with spare tires would be inclined to be careless!

As pointed out by Mr. Spangenberg, contradictory statistics exist and differing conclusions may be drawn from even the same statistics.

The Department of Transportation statistics do not deal adequately with the effect of inadequate insurance limits or on the inadequacy of payments in the major and horrendous automobile oriented tragedies.

It would appear obvious that the more severe the injury, the more likely the need of a protracted time to determine the nature, extent, severity and duration of the injury and to fairly arrive at an appraisal of the justly due damages.

The insurance industry is to be praised for some of the reforms they have brought about, however belatedly, such as voluntary med pay, accident and health provisions (death and dismemberment) and on a variable basis, uninsured motorist coverage. Perhaps a part of the inadequacy of payment in major cases may be explained by the inexplicable reluctance of the bulk of the industry to write uninsured coverage for larger than mandatory financial responsibility limits. The peculiarity is even greater when one acknowledges that such coverage, just as all coverage, should be written on a sound, actuarially computed fair premium basis. With that thought in mind, however, one is compelled to ask why a driver is permitted to obtain what is, for all practical purposes, unlimited coverage to protect himself from the claims of the stranger he may tortiously hurt and to thereby assure the availability of a fund for the payment of such justly due claims, but on the other hand, is precluded from obtaining a sensible and adequate limit for himself and family and his passengers should they unfortunately be injured through the wrongdoing of an uninsured motorist.

Many reforms exist within the confines of the traditional tort system that will and should increase the amount of funds derived from insurance premiums for the payment of the auto accident victim. Admittedly some may increase premiums somewhat, and others will substantially reduce them. Illustratively, the reduction of the frequency of contested claims under the voluntary payment of economic losses to the innocent victim and the open end settlement have reduced the frequency of claims for the "intangibles" (payment of which is deplored by the proponents of no fault), thus reducing the ultimate sums to be paid out through the insurance industry. Further economies can be had by resorting to arbitration of the lesser claims, preferably upon a voluntary but strongly encouraged basis. Non-unanimous jury verdicts will shorten the length of jury trials, and the use of less than twelve-man juries on a non-unanimous basis, preserving a fair number of preemptive challenges, will reduce the cost of the judicial system, shorten time necessary for voir dire and jury deliberation. Making available to the auto victim the right to submit an offer of judgment in the same manner as the insurance carrier defendant may now do will promote settlements and lessen the outlay. Most who consider the matter adequately agree that the availability by discovery means of information as to insurance limits, now uniformly available in federal courts, will promote settle-

ments and lessen the likelihood of trials. Allowing interest at a realistic rate from the time of the auto accident or the date of commencement of suit will discourage dilatory tactics on the part of the insurers and lessen the likelihood of trials.

A reappraisal of the collateral source rule to preclude duplicate or multiple recovery of funds provided collaterally without any cost or contribution by the insured or his family will lessen the required expenditure to tort victims.

The American Bar Association in its study of automobile reparations recommended against the no fault approach but recommended substitution of the doctrine of contributory fault or comparative negligence for the long outmoded and outrageous doctrine of contributory negligence. Although the Bar Association Committee recommended the Wisconsin plan, many urged as far preferable either the Mississippi (F.E.L.A.) plan of true comparative negligence. Others urge equally strongly either the now current Wisconsin plan permitting recovery if the victim's negligence is no greater than that of the defendant, or the plans adopted in New Hampshire and Maine. The substitution of comparative negligence or contributory fault along with the abolition of the vestiges of governmental immunity, family immunity and guest statutes all will tend to minimize some of the gross inequities of the present system.

The public outcry with regard to the liability insurance function in the auto reparations system deals largely with matters of arbitrary cancellations, and outrageous delays and rating practices. These can be corrected within the confines of the traditional tort system.

Where conflict and contradictions exist in provisions dealing with excess coverage, primary coverage, concurrent coverage, duplicate and overlapping coverages, the same can be clarified and litigation minimized or avoided.

Strict enforcing of motor vehicle operators' license laws, bumper protection, and safety equipment statutes should decrease the frequency and the severity of injuries and deaths resulting from auto oriented accidents.

Stricter enforcement of license suspension and revocation statutes or operation of vehicles while under the influence of drugs and perhaps alcohol, or repeated offenses, should reduce highway accident tolls.

Uniformity of adequate licensing standards for all motor vehicle operators is to be encouraged.

A more effective system of requiring mandatory liability insurance coverages, realistic and adequate limits will certainly go a long ways towards correcting some of the shortcomings and abuses pointed out in the Department of Transportation's study.

Thoughts should be given to tying the mandatory liability insurance requirements to the vehicle rather than simply to the operator's license. It is suggested that the mandatory insurance provisions can be more strictly enforced geared to the license plates than to the operator's license. Illustratively, worthy of study would be a program whereby color coded bi-monthly license plate stickers could be provided the insurance company, to be mailed out bi-monthly or quarterly as the case may be, thereby confirming the continued existence of the required liability insurance. Should the coverage cease to exist for whatever valid reason, the unused stickers could be returned to the state licensing entity. It would appear obvious that a motor vehicle lacking the color coded time-oriented sticker would be much more readily observed and the operator apprehended and inquiry made as to his insurance than relying upon detecting the driver without the operator's license.

If from a broad sociological standpoint there should be an expansion of disability benefits and health and welfare benefits without regard to fault, such plan can be devised and supplemented. One such plan proposes that a federally operated government corporation be created to be funded by a very modest gasoline tax to provide emergency economic loss payments up to \$1000 for losses incurred within six months without regard to fault. To assure that there would be no duplication of recovery, the amount of any tort system judgment or settlement or award is either reduced by the amount received from the "fund" or "reimbursement paid on a net basis after pro rata share of attorneys' fees and costs.

Similarly if it is truly felt as it was in the State of Oregon that there should be even larger first party benefits, mandatorily provided without regard to fault, this can be done legislatively as was done in Oregon, mandating that all liability policies contain provisions for first party medical coverage and first party economic loss coverage without regard to fault, preserving meanwhile the traditional tort remedy.

CONCLUSIONS

It is respectfully submitted that all things considered, the Senate and the House of Representatives of the United States should not at this time proceed with federal legislation dealing with no fault automobile liability concepts that would preclude a state by state evaluation and approach. It is further suggested that additional study is needed as to the reforms available within the traditional tort system that preserve to the public its very valuable right of recovery of damages for pain and suffering, that is to say, the right to recover full, fair and just compensation from the wrongdoer when one is the innocent victim.

[From the Pacific Northwest Underwriter, May 1956]

THE TRUST FUND THEORY AS APPLIED TO SETTLEMENT OF CLAIMS

(By B. J. Curran)

(This is a portion of a talk presented by Wolfstone at a meeting of the Seattle Casualty Adjusters Association on April 20. Wolfstone is defense attorney for several insurance companies in the Seattle area.)

In the evaluation of claims we know of course that the plaintiff always views the facts optimistically in terms of maximum possible recovery. We also know that all too often the persons associated with the defense of the case—that is to say the claims personnel and the attorneys for the defense—view things skeptically and cynically, and sometimes even scoffingly.

There is all too commonly found an attitude that claims are for the most part fraudulent or exaggerated, which feeling when present, sometimes tends to prevent a fair evaluation of the claim by those having the defense responsibility for the claim evaluation.

It is seriously suggested that those having this responsibility of evaluating and settling claims upon the behalf of the defense should consider the fact that the insurance company stands in a trust relationship.

The public deposits its money with the insurance company in the form of premiums. One of the purposes of so doing is, of course, to protect against the shock and expense of personal verdicts or judgments.

Another and equally proper consideration for such payment is that a fund is thereby established by the public for the purpose of justly paying the fair value of just claims.

As certainly as it may be said that a company would be derelict in its duty to its policyholders to pay needlessly or excessively unwarranted claims, by the same token, it can be urged that the company owes an equal duty to the public to fairly evaluate claims and to pay justly such claims.

As above indicated the company stands in a fiduciary or trustee capacity. It is true that the company has a selfish motive in settling claims at the lowest possible figure in that any excess or residue of premium over and above cost of procuring of the business, administrative expense, cost of servicing claims and payment of claims, is left to the company as an operating profit.

On the other hand, the nature of the organization of the insurance industry and of insurance codes is such that if in a given year or periods, the insurance industry suffers excessive losses—that is to say losses disproportionate to premium and funds on hand—a rate increase inevitably follows so that the companies can recapture their losses in the subsequent years.

Such being the case, the company owes a strict duty to fairly evaluate claims and to pay a just amount in settlement of proper claims rather than attempting to "buy" a release at a figure which the company and its personnel know to be a shockingly inadequate one.

All too often an effort is made to "buy" a release for a nominal sum even though it is known that the claims are far more serious than the amount of the settlement indicates, and that the liability is far more clear than the amount of the settlement indicates.

It is respectfully submitted that this does not represent an honest approach to the duty and function of an insurer and that it is contrary to sound public policy as well as sound business management.

Not always, of course, but very frequently, the payment or the offer of a ridiculously low settlement figure results in the claimant consulting attorneys

who are more competent to evaluate such claims. The net result is that more claims go into suit and ultimately far greater amounts are paid.

The very fact that claims practically inevitably increase in value as soon as an attorney comes into the picture is some indication that the evaluation of the claim prior to the attorney being in the picture was probably on too low a scale.

It should further be kept in mind that the offer of a ridiculously low settlement figure increases the expense to the company not only by the ultimate paying of a larger settlement award, which is adequate for not only the claimant but also to compensate for the attorney's fees, but it further entails absorbing the cost of multiple medical examinations and of defense investigation and defense counsel as well.

If the companies would in some instances increase their settlement sights by paying more liberally on legitimate claims, the companies would save this considerable increase in operating expense, and increased size of settlements and awards ultimately paid. The net result would be that the public would be spared the necessity of commencing and prosecuting needless litigation and the insurance industry as such would certainly have a higher standing with the public.

It is not suggested that the insurance industries should play Santa Claus, but on the other hand, it is suggested that the insurance company might minimize the defense outlook filled with skepticism, cynicism and an attitude of "what can we get out for" and that the insurance company could and properly should instead approach the claims from the standpoint of "what is the true, sound, fair settlement value of this claim?"

Senator HART. Next we will hear from Mr. Arthur C. Mertz who comes to us as a witness for the National Association of Independent Insurers.

STATEMENT OF ARTHUR C. MERTZ, VICE PRESIDENT AND GENERAL COUNSEL, NATIONAL ASSOCIATION OF INDEPENDENT INSURERS, WASHINGTON, D.C.; ACCOMPANIED BY CHARLES HEWETT, ACTUARY, ALLSTATE INSURANCE CO. AND CHAIRMAN, SPECIAL COMMITTEE, ACTUARIAL COMMITTEE ON COSTING

Mr. MERTZ. Thank you, Mr. Chairman.

I would like to point out and also extend a note of apology on this point that the notice of these hearings came to me on vacation. I came back from vacation, and in the short time that I had to make a prepared statement several errors occurred in the original statement which was supplied to the committee members, I believe, yesterday.

I want to supply the committee now with a clean copy of our statement which should replace the other.

Senator HART. Let us make sure of that and order that the corrected statement be printed in the record.

Mr. MERTZ. My name is Arthur C. Mertz. I am vice president and general counsel of the National Association of Independent Insurers.

With me today is Mr. Charles Hewett, actuary of Allstate Insurance Co., who is the chairman of our special committee, actuarial committee on costing.

NAII is a voluntary national trade association of some 533 insurers of all types, both stock and nonstock, whose membership provides a representative cross section of the casualty and fire insurance business in America.

Our companies range in size from the smallest one-State entrepreneurs to the very largest national writers and they reflect all forms of merchandising. These companies wrote over 50 percent of the insured automobiles in the United States.

The position of our association can be summed up as follows:

(1) We fully recognize that the existing damage reparations system for automobile accidents is beset by certain problems and shortcomings which need correction, but we believe it likewise possesses basic features and concepts which should be preserved.

(2) We are committed to prompt reform of the system, through modified no-fault measures that broaden protection and expedite payments while retaining vital rights. We are actively working in the various State legislatures to accomplish that end, and we are encouraged.

(3) There is no need for a Federal law governing automobile accident reparations, in view of the strong reform trend now underway and gathering momentum at the State level, as evidenced by the modified no-fault programs recently enacted in five States and the programs shaping up in many other States.

(4) Adoption of a Federal no-fault law as manifested in S. 945, Committee Print No. 1, would be a grievous and very costly mistake, whose unfortunate consequences the American public neither desires nor deserves. Costwise, as I shall point out, actuarial projections indicate that this measure will bring about insurance premium hikes of 10 percent to 45 percent and the optional coverages many motorists will feel impelled to buy to replace existing rights of recovery abolished by the act will raise their premiums at least 25 percent to 100 percent.

I am talking there about average premiums. More about that in a moment.

Congressional action of some type regarding the auto accident reparations problem might be justified if the States lacked the ability or capacity adequately to deal with the problem. Such is not the case.

The States certainly possess and have demonstrated that ability and capacity.

Indeed, because the formulation and administration of laws governing the rights and responsibilities of motorists and auto accident victims, as well as the regulation of automobile insurance, have long been carried out by the States; State legislators and officials are in an ideal position to develop, test, and perfect appropriate reform measures.

During the no-fault hearings by your committee in May of this year a pivotal issue seemed to be whether the States would be willing and able to act expeditiously in this regard. We would hope that the excellent record of the States in enacting insolvency fund laws, uninsured motorist coverage statutes, and other key insurance legislation, and particularly the adoption of modified no-fault programs in five States—or depending how you count it, seven States—within a little over a year's time, will serve to lay that question to rest.

Our association and its members are actively promoting State legislation very similarly to the newly enacted Illinois plan. Our program, the dual protection plan, mandates the broadening of all private passenger auto insurance policies and reforms the tort system so as to:

(1) Provide immediate compensation of the auto accident victim's basic medical expenses and disability losses regardless of fault.

Referring to the discussion with Mr. Spangenberg, our plan would take care of total medical expenses and most disability losses of 90 to

95 percent of the accident victims, and it would also pay the basic economic losses of the remaining more seriously injured victims. So it would be a great step forward.

(2) Require the offering of high-limits supplemental catastrophe no-fault coverage with all policies.

(3) Preserve but delimit in less serious cases the right to general tort damages for pain and suffering.

(4) Encourage rehabilitation.

(5) Greatly increase the speed and cost efficiency of the system.

(6) Alleviate court congestion.

(7) Stabilize or reduce rates.

More details on its provisions are set forth at pages in our May 7, 1971, statement on the original S. 945.

As indicated by Secretary Volpe in his report and testimony to the Congress, the DOT study itself has pointed up the wisdom of exercising caution in deciding exactly what steps should be taken in the way of reform measures.

Even the massive data and findings piled up by DOT do not lead automatically to "easy solutions" of the auto accident compensation problem, according to Mr. Volpe.

"Much legitimate uncertainty" exists as to "how far and how fast the public wants or is willing to go in changing the reparations system."

The complexity of the problem, and the existence of honest disagreement among informed people as to what remedial measures are best, point to the wisdom of healthy experimentation and change at the State level, rather than Federal action abruptly overturning the whole auto reparations system nationally.

We strongly concur with Secretary Volpe's admonitions on these points. It is hard to find a phenomenon in today's society that is more complicated, abstruse and difficult to analyze scientifically than the phenomenon of the automobile accident, its causes, and its consequences.

It is especially difficult to accurately measure deeply inbedded public attitudes and motivations relative to auto accidents or to predict the ultimate impact on public attitudes and behavior if the rules for compensating accident victims were drastically changed.

The DOT opinion surveys, like some others before them, display a confusing patchwork of viewpoints and reactions, with inconsistent and conflicting answers by some of the same interviewees to complementary but conversely phrased questions.

Accordingly, we do not believe that satisfactory answers to the demands of various segments of the public for reform—some of them mutually conflicting—can be produced in one fell swoop by enactment of a Federal law.

This is particularly true of an extreme measure as S. 945, Committee Print No. 1, which we fear will create more problems than it solves.

The only promising avenue for accommodating and reconciling those diverse complaints and demands, and achieving realistic, durable solutions lies in healthy experimentation by the States with "middle-of-the-road" programs—programs which strike a reasonable balance between the fault and no-fault concepts. In developing and offering to

the State legislatures our dual protection plan we are seeking to aid in that process.

In our May 7 statement we set forth a number of fundamental objections to S. 945 as originally introduced. Committee Print No. 1 reflects no improvements over the original bill in these regards.

On the contrary, its drafters have moved from an extreme form of no-fault program to a total no-fault program which will be even more costly, unjust, and inimical to the long-range public interest than the original.

In the interests of time, I shall touch only briefly on each of the more serious evils and defects we see in this legislation.

In our previous testimony we expressed grave concern over the public policy and safety implications of adoption by Congress of legislation freeing motorists of personal accountability to persons they wrongfully kill or injure. Original S. 945 would have taken a dangerous step in that direction.

Committee Print No. 1 goes all the way and completely abolishes personal accountability. Our previous arguments therefore apply even more unequivocally.

We recognize that considerable controversy exists over the question of the exact extent to which driver behavior is influenced consciously or subconsciously by awareness that one is accountable for injuries or damage he negligently inflicts. In our considered judgment, supported by experience and a number of academic studies, a statute embodying the concept that the Government no longer cares who is responsible for auto accidents cannot fail to cause some significant deterioration of public attitudes toward driving, and to undermine to some significant extent the motivation for enforcement of safety laws.

Admittedly, this cannot be proved with finality, in advance. But, on the other hand, the doubters cannot provide any guarantee, either, that it will not happen.

Accordingly, we would simply ask whether it is worth the gamble to abolish personal accountability when what is at stake is the possibility of thousands of additional deaths and hundreds of thousands of additional injuries?

Is it worth risking this eventuality under a total no-fault plan such as S. 945, Committee Print No. 1, when less drastic alternatives such as the Illinois plan and dual protection are available, which preserve personal accountability for negligent misconduct?

We respectfully submit that it is not worth the gamble.

Motorists are already chafing under the very size of some auto insurance premiums necessitated by today's heavy toll of accidents and losses. NAAI and others in our industry are striving hard to reduce or stabilize premiums through many avenues, including sponsorship of our dual protection plan.

Any statutory program mandating sizable rate increases for a large segment of the public is in our opinion unthinkable. Yet this is precisely what Committee Print No. 1 of S. 945 would do.

Actuarial projections supplied to us by the chairman of our Special Actuarial Committee on Costing indicate that, conservatively speaking, adoption of Committee Print No. 1 of S. 945 would have the following impact on insurance premium levels—I am talking about average payments now.

For those motorists who now carry a full package of auto insurance coverage (BI and PD liability, collision and comprehensive, and uninsured motorist and medical payments coverage), and who under S. 945, Committee Print No. 1 purchase the required basic injury coverages plus collision and comprehensive as they are now purchasing them, it will mean a 10 percent to 30 percent increase in average premiums, depending on the State.

If those motorists decide also to buy the optional "noneconomic loss" coverage (since S. 945 abolishes their tort right of recovery for pain, suffering, et cetera) it will mean a 25- to 60-percent increase over existing premiums.

Motorists who currently carry just the minimum auto insurance coverages will fare even worse, percentage-wise.

Even if they continue under S. 945, Committee Print No. 1, to buy only the basic coverages it requires, their average premiums will rise between 10 percent and 45 percent.

If they decide to buy the optional "noneconomic loss" coverage, it will add 40- to 100-percent increase over their existing premiums.

In the footnote we have indicated that if those same motorists, now that they have no right to recover property damage coverages from a negligent third party, decide they had better buy collision coverage, it will add another 30 to 100 percent on top of those increases.

As alarming as these rate projections are, they don't even tell the whole story, for they represent only the increases in the average premiums for motorists with various typical packages of coverage.

The increases will be even more sizable for some categories of motorists; some of those who will be hit relatively the hardest will be those car owners who present the least hazard to others—such as the head of a large family who is a careful driver and the farmer with comparatively low usage of congested highways and streets.

I might add to the prepared statement here, that the additional amount by which the rate for motorists in some of these categories might go up could be another doubling of their basic rates. If the committee is interested, we will be glad to explore that in more detail at a later period.

The present system not only keeps the onus of responsibility on the guilty party, but, generally speaking, operates to place most of the burden of accident losses and insurance premium costs on the shoulders of those vehicle owners and operators who create the greatest hazard. The Illinois plan and our dual protection plan preserve this sound and equitable principle. S. 945 in original form would have gone a long way toward abrogating it. Committee Print No. 1 utterly destroys the principle. It in effect decrees that the less hazardous motorists shall bear the cost of totally insuring themselves against all the extraordinary injuries and damages to which they are exposed at the hands of those who present a greater than ordinary hazard—either by reason of their youth, their driving habits, or their greater usage of the highways.

A prime example of the arbitrary and unjust way that Committee Print No. 1 of S. 945 reverses responsibilities and shifts burdens is its treatment of pain and suffering and other "noneconomic" damages.

defined in the bill, which has been discussed already at some length. Whereas the original draft of S. 945 would have left at least the catastrophic harm situations under the fault system, the Print No. 1 abolished that. The system erected in its place deals with two extreme situations:

1. A "car owner" and his spouse and dependents will go completely uncompensated for pain and suffering and other "noneconomic" losses as defined by the bill, unless the car owner has affirmatively elected to insure himself and his family against such losses, by purchasing the optional no-fault coverage for that purpose.

2. Anyone who is not a car owner or the spouse or dependent of a car owner will on the other hand be compensated not only for economic losses, but also for pain and suffering (as measured by tort law of the State in question) and other "noneconomic" losses, even where he is at fault.

The inclusion of these provisions in Committee Print No. 1 of S. 945 evidences an awareness by the drafters that, as we have long maintained, the public values highly its right to sue for intangible as well as tangible damages, and will not react kindly to having it abolished. But the supposed answer proffered by Committee Print No. 1 is really no answer at all. It not only won't satisfy the problem, but it will create vexing new problems and inequities.

For one thing, the optional noneconomic loss coverage will be so costly that many motorists in the lower income brackets simply cannot afford it or will not buy it. As I have indicated, merely to buy Committee Print No. 1's minimum compulsory coverages alone, many motorists today paying \$100 for basic coverage will have to pay \$145. Many will refuse to pay a total of \$200—using that as an example—or even more in some cases, for a package including optional "noneconomic loss" coverage.

Committee Print No. 1 of S. 945 has thereby destroyed a vitally important right of recovery and tried to replace it with a substitute that is, practically speaking, either beyond the reach of or unsalable to a large segment of the public.

By footnote we have indicated a number of other inequities and incongruities which are created by the treatment of pain-and-suffering coverage under the draft of Committee Print No. 1. I will not stop on those at this point.

In our testimony on the original S. 945 (May 7 statement) we objected to the fact that the bill abrogated the vitally important principle that motoring should pay its own way in our society. By making the mandatory no-fault economic loss coverage excess over virtually all other private or public insurance systems and benefit sources (except where those systems and sources explicitly elect to be secondary), the original S. 945 would have thrust on systems outside the auto reparations system most of the accident loss costs that motoring should itself bear.

Committee Print No. 1 effects some restructuring of the provisions relating to this issue, in which the situation under original S. 945 is in one regard slightly improved but in other regards worsened. On balance, our original objections are still unanswered, and we reassert them.

S. 945 both in its original and present form constitutes a direct, clear-cut move for Federal entry into the regulation of the auto insurance business, which is now and should remain the province of the States. In the course of this move, the Federal Government under the bill's provision would also usurp fundamental company management prerogatives, destroy competition, initiative, and innovation in the pricing and marketing of automobile insurance, and imperil the growth and even the soundness of companies.

In my prepared statement, I have referred to a number of particulars in which Committee Print No. 1 does provide for de facto Federal regulation, and I have noted that what Committee Print No. 1 adds up to is dual regulation, with the Federal Government duplicating a complicated and extremely expensive regulatory process, already being performed adequately by the State. The countless additional millions of dollars this would cost the taxpayers annually cannot be justified. Worse than that is the destruction Committee Print No. 1's straightjacketing restrictions wreak on competition, innovation, and the healthy growth and soundness of our business. If the property and casualty insurance industry is to continue to attract risk capital and develop additional surplus to meet the market needs of an ever-expanding motoring population, it needs not more, but fewer, shackles and fetters on the pricing and marketing of its products.

In this regulatory context, the most dangerous single provision in the bill is subsection 5(g). With but two very tenuous exceptions, this subsection would require every insurer, large or small, to accept every applicant who has a license and tenders a premium, and to insure him for life if he desires.

What makes this provision all the more insidious is that it carries the false front of a "consumer-oriented" measure, since it purports to guarantee the availability of auto insurance at all times in a company of an individual's choice. In actuality, such a measure won't add one penny to our industry's market capacity. To the contrary, it will probably serve to constrict that overall capacity.

It should be noted that the automobile insurance industry today is already guaranteeing the availability of essential automobile insurance coverage to every licensed motorist who from a safety standpoint deserves to be on the highway. It is doing so collectively, through auto insurance plans (assigned risk) in every State, which are undergoing constant broadening and streamlining.

We know of no other comparable industry, incidentally, that affords such a service: Banks, for example, do not provide "assigned borrower's" plans where a poor credit risk can go and get a loan without collateral.

As though our industry's collective guarantees of insurance availability were not enough, Committee Print No. 1 seeks to force every automobile insurance company in America to individually guarantee, in effect, that it will accept and insure perpetually every customer who walks in, to the point where it reaches the brink of insolvency. This utterly unreasonable (and possibly unconstitutional) requirement is unprecedented in the annals of American business.

By footnote, I note that it goes considerably beyond what is demanded of public utilities and at the same time does not recognize

the fact that public utilities do not undertake the risks and the hazards that our business faces.

This provision, even though it is labeled or it is intended, I am sure, as a consumer-oriented provision, will destroy competition, forestall entry of new risk capital into our industry, force scores of smaller companies out of business, and force many who remain to seek higher rates. In practice, this would be an antismall business measure.

In conclusion, for these and other reasons, our association is strongly opposed to S. 845, both as originally introduced and as revised in Committee Print No. 1. It is our position that no congressional legislation of any kind relating to the no-fault issue is needed or warranted, either creating a federal system as these bills would do or seeking to superimpose a single, preconceived pattern on all the States. Federal legislation will stifle the needed experimentation that is so vital to sound auto insurance reform. The States are on the move in the consideration and adoption of modified no-fault programs that constitute a great step forward, but do not involve added costs or risks, or the sacrifice of accident victims' basic rights.

As I indicated, our association is certainly in the forefront, urging on those States that they move in that direction. We are convinced that the State avenue is the only avenue which affords the flexibility and adaptability essential for testing and perfecting a modernized reparation system that will best satisfy the long-range, diverse demands of the motoring public.

Senator BAKER. Mr. Mertz, I thank you very much. I apologize for my inability to be here for the entire length of your statement, and I apologize on behalf of the chairman of the subcommittee, Senator Hart, that he had to leave to attend a session of another committee for the markup of a bill in which he is involved.

With that in view, I suppose it would be best to assure you that I will carefully read and consider your statement in its entirety. Would you be willing to answer questions that might later be submitted by this subcommittee for inclusion in the record?

Mr. MERTZ. We would be very happy for that information to be furnished.

Senator BAKER. I want to thank you very much for your testimony and, once again, to apologize for being unable to be present.

(The statement and questions and answers follow :)

STATEMENT OF ARTHUR C. MERTZ, VICE PRESIDENT AND GENERAL COUNSEL,
NATIONAL ASSOCIATION OF INDEPENDENT INSURERS

NAII is a voluntary national trade association of some 533 insurers of all types, both stock and non-stock, whose membership provides a representative cross-section of the casualty and fire insurance business in America. Our companies range in size from the smallest one-state entrepreneurs to the very largest national writers and they reflect all forms of merchandising. These companies write over 50% of the insured automobiles in the United States.

The position of our Association can be summed up as follows:

1. We fully recognize that the existing damage reparations system for automobile accidents is beset by certain problems and shortcomings which need correction, we believe it likewise possesses basic features and concepts which should be preserved.

2. We are committed to prompt reform of the system, through modified no-fault measures that broaden protection and expedite payments while retaining vital rights. We are actively working in the various state legislatures to accomplish that end, and we are encouraged.

3. There is no need for a federal law governing automobile accident reparations, in view of the strong reform trend now under way and gathering momen-

tum at the state level, as evidenced by the modified no-fault programs recently enacted in five states and the programs shaping up in many other states.

4. Adoption of a federal no-fault law as manifested in S-945, Committee Print No. 1, would be a grievous and very costly mistake, whose unfortunate consequences the American public neither desires nor deserves. Costwise, as I shall point out, actuarial projections indicate that this measure will bring about insurance premium hikes of 10% to 45% and the optional coverages many motorists will feel impelled to buy to replace existing rights of recovery abolished by the Act will raise their premiums at least 25% to 100%.

NO NEED FOR FEDERAL LEGISLATION

Congressional action of some type regarding the auto accident reparations problem might be justified if the states lacked the ability or capacity adequately to deal with the problem. Such is *not* the case. The states certainly possess and have demonstrated that ability and capacity. Indeed, because the formulation and administration of laws governing the rights and responsibilities of motorists and auto accident victims, as well as the regulation of automobile insurance, have long been carried out by the states, state legislators and officials are in an ideal position to develop, test, and perfect appropriate reform measures.

During the no-fault hearings by your Committee in May of this year, a pivotal issue seemed to be whether the states would be willing and able to act expeditiously in this regard.¹ We would hope that the excellent record of the states in enacting insolvency fund laws, uninsured motorist covering statutes, and other key insurance legislation, and particularly the adoption of modified no-fault programs in five states² within a little over a year's time, will serve to lay that question to rest.

Our Association and its members are actively promoting state legislation very similar to the newly-enacted Illinois Plan. Our program, the Dual Protection Plan, mandates the broadening of all private passenger auto insurance policies and reforms the tort system so as to:

Provide immediate compensation of the auto accident victim's basic medical expenses and disability losses regardless of fault.

Require the offering of high-limits supplemental catastrophe no-fault coverage with all policies.

Preserve but delimit in less serious cases the right to general tort damages for pain and suffering.

Encourage rehabilitation.

Greatly increase the speed and cost efficiency of the system.

Alleviate court congestion.

Stabilize or reduce rates.

More details on its provisions are set forth a pp. 3-4 of our May 7, 1971, statement.

ATTEMPTED CONGRESSIONAL IMPOSITION OF A SINGLE, NATIONAL "SOLUTION" WOULD BE UNWISE

As indicated by Secretary Volpe in his report and testimony to the Congress, the DOT study itself has pointed up the wisdom of exercising caution in deciding exactly what steps should be taken in the way of reform measures.

Even the massive data and findings piled up by DOT do not lead automatically to "easy solutions" of the auto accident compensation problem, according to Mr. Volpe.

"Much legitimate uncertainty" exists as to "how far and how fast the public wants or is willing to go in changing the reparations system."

The complexity of the problem, and the existence of honest disagreement among informed people as to what remedial measures are best, point to the wisdom of healthy experimentation and change at the state level, rather than federal action abruptly overturning the whole auto reparations system nationally.

¹ As we then pointed out, in view of the extreme complexity and controversy of this subject, and the fact that the federal studies had stretched over three years and were just then completed, it would hardly be fair to expect precipitate action by 50 states overturning their carefully-developed accident reparation systems without reasonable opportunity for evaluation of the DOT report and other pertinent facts and considerations.

² Massachusetts, Florida, Delaware, Oregon, and Illinois.

We strongly concur with Secretary Volpe's admonitions on these points. It is hard to find a phenomenon in today's society that is more complicated, abstruse, and difficult to analyze scientifically than the phenomenon of the automobile accident, its causes, and its consequences. It is especially difficult to accurately measure deeply-imbedded public attitudes and motivations relative to auto accidents, or to predict the ultimate impact on public attitudes and behavior if the rules for compensating accident victims were drastically changed. The DOT opinion surveys, like some others before them, display a confusing patchwork of viewpoints and reactions, with inconsistent and conflicting answers by some of the same interviewees to complementary but conversely-phrased questions.

Accordingly, we do not believe that satisfactory answers to the demands of various segments of the public for reform—some of them mutually conflicting—can be produced in one fell swoop by enactment of a federal law. This is particularly true of an extreme measure such as S-945, Committee Print No. 1, which we fear will create more problems than it solves. The only promising avenue for accommodating and reconciling those diverse complaints and demands, and achieving realistic, durable solutions lies in healthy experimentation by the states with "middle-of-the-road" programs—programs which strike a reasonable balance between the fault and no-fault concepts. In developing and offering to the state legislatures our Dual Protection Plan, we are seeking to aid in that process.

COMMENTARY ON S-945, COMMITTEE PRINT NO. 1

In our May 7 statement we set forth a number of fundamental objections to S-945 as originally introduced. Committee Print No. 1 reflects no improvements over the original in these regards. On the contrary, its drafters have moved from an extreme form of no-fault program to a total no-fault program which will be even more costly, unjust, and inimical to the long-range public interest than the original.

In the interests of time, I shall touch only briefly on each of the more serious evils and defects we see in this legislation.

PERSONAL ACCOUNTABILITY FOR MISCONDUCT

In our previous testimony, we expressed grave concern over the public policy and safety implications of adoption by Congress of legislation freeing motorists of personal accountability to persons they wrongfully kill or injure. Original S-945 would have taken a dangerous step in that direction. Committee Print No. 1 goes all the way and completely abolishes personal accountability. Our previous arguments therefore apply even more unequivocally.

We recognize that considerable controversy exists over the question of the exact extent to which driver behavior is influenced consciously or subconsciously by awareness that one is accountable for injuries or damage he negligently inflicts. In our considered judgment, supported by experience and a number of academic studies, a statute embodying the concept that the government *no longer cares who is responsible for auto accidents* cannot fail to cause some significant deterioration of public attitudes toward driving, and to undermine to some significant extent the motivation for enforcement of safety laws.

Admittedly, this cannot be proved with finally, in advance. But on the other hand, the doubters cannot provide any guarantee, either, that it will *not* happen.

Accordingly, we would simply ask whether it is *worth the gamble* to abolish personal accountability, when what is at stake is the possibility of thousands of additional deaths and hundreds of thousands of additional injuries? Is it worth risking this eventuality under a total no-fault plan such as S-945, Committee Print No. 1, when less drastic alternatives such as the Illinois Plan and Dual Protection are available, which preserve personal accountability for negligent misconduct? We respectfully submit that it is not worth the gamble.

THE TREMENDOUS ADDED PREMIUM COSTS INHERENT IN THIS PROGRAM

Motorists are already chafing under the very size of some auto insurance premiums necessitated by today's heavy toll of accidents and losses. NAI and others in our industry are striving hard to reduce or stabilize premiums through many avenues, including sponsorship of our Dual Protection Plan.

Any statutory program mandating sizable rate increases for a large segment of the public is in our opinion unthinkable. Yet this is precisely what Committee Print No. 1 of S-945 would do.

Actuarial projections supplied to us by the Chairman of our Special Actuarial Committee on Costing indicate that, conservatively speaking, adoption of Committee Print No. 1 of S-945 would have the following impact on insurance premium levels:

For those motorists who now carry a full package of auto insurance coverage (BI and PD liability, collision and comprehensive, and uninsured motorist and medical payments coverage), and who under S-945, Committee Print No. 1, purchase the required basic injury coverages plus collision and comprehensive, it will mean a 10% or 30% increase in average premiums, depending on the state.

If those motorists decide also to buy the optional "non-economic loss" coverage (since S-945 abolishes their tort right of recovery for pain, suffering, etc.) it will mean a 25% to 60% increase over existing premiums.

Motorists who currently carry just the minimum auto insurance coverages¹ will fare even worse, percentagewise.

Even if they continue under S-945, Committee Print No. 1, to buy only the basic coverages it requires, their average premiums will rise *between 10% and 45%*.

If they decide to buy the optional "non-economic loss" coverage it will add 40% to 100% increase over their existing premiums.²

INEQUITABLE SHIFT IN THE ACCIDENT LOSS BURDEN

As alarming as these rate projections are, they don't even tell the whole story, for they represent only the increases in the *average* premiums for motorists with various typical packages of coverage. The increases will be even more sizeable for some categories of motorists; those who will be hit relatively the hardest will be those car owners who present the least hazard to others—such as the head of a large family who is a careful driver and the farmer with comparatively low usage of congested highways and streets.

The present system not only keeps the onus of responsibility on the guilty party, but generally speaking, operates to place most of the burden of accident losses and insurance premium costs on the shoulders of those vehicle owners and operators who create the greatest hazard. The Illinois Plan and our Dual Protection Plan preserve this sound and equitable principle. S-945 in original form would have gone a long way toward abrogating it. Committee Print No. 1 utterly destroys the principle. It in effect decrees that the less hazardous motorists shall bear the cost of totally insuring themselves against all the extraordinary injuries and damages to which they are exposed at the hands of those who present a greater than ordinary hazard—either by reason of their youth, their driving habits, or their greater usage of the highways.

TREATMENT OF PAIN AND SUFFERING AND OTHER "NON-ECONOMIC" DAMAGES

A prime example of the arbitrary and unjust way that Committee Print No. 1 of S-945 reverses responsibilities and shifts burdens is its treatment of pain and suffering and other "non-economic" damages³ as defined in the bill. All right of recovery in tort (even in "catastrophic harm" situations which original S-945 would have left under the fault system) is abolished. The system erected in its place deals as follows with non-economic losses:

1. A "car owner" and his spouse and dependents will go completely uncompensated for pain and suffering and other "non-economic" losses as defined by the bill, unless the car owner has affirmatively elected to insure himself and his family against such losses, by purchasing the optional no-fault coverage for that purpose.

2. Anyone who is not a car owner or the spouse or dependent of a car owner will on the other hand be compensated⁴ not only for economic losses, but also for pain and suffering (as measured by tort law of the state in question) and other "non-economic" losses, even where he is at fault.

¹ That is, the minimum bodily injury and property damage liability coverages and uninsured motorist coverage specified in the state financial responsibility or compulsory insurance laws.

² If such motorists also decide they now need collision coverage, since S-945, Committee Print No. 1 abolished their right to recover from a negligent third party who damages their car, it will add another 30% to 120% to their premium bill.

³ The term "damage other than economic loss" under Sec. 2(17) includes not only intangible damages, but also tangible damage in excess of "economic loss" as defined in Sec. 2(13). Wage loss above \$1,000 a month is one example of the latter.

⁴ By the insurer or insurers of the car or cars involved, or in the case of uninsured vehicles, by the assigned case plan created under the bill.

The inclusion of these provisions in Committee Print No. 1 of S-945 evidences an awareness by the drafters that, as we have long maintained, the public values highly its right to sue for intangible as well as tangible damages, and will not react kindly to having it abolished. But the supposed answer proffered by Committee Print No. 1 is really no answer at all. It not only won't satisfy the problem, but it will create vexing new problems and inequities.

For one thing, the optional non-economic loss coverage will be so costly that many motorists in the lower income brackets simply cannot afford it or will not buy it. As I have indicated, merely to buy Committee Print 1's minimum compulsory coverages alone, many motorists today paying \$100 for basic coverage will have to pay \$145. Many will refuse to pay a total of \$200, or even more in some cases, for a package including optional "non-economic loss" coverage.

Committee Print No. 1 of S-945 has thereby destroyed a vitally important right of recovery and tried to replace it with a substitute that is, practically speaking, either beyond the reach of or unsaleable to a large segment of the public.⁶

A host of other problems and imponderables too numerous to mention here are presented by the treatment given by Committee Print No. 1 to pain and suffering and other "non-economic" losses.⁷ We believe that after the right of tort recovery for intangible damages is once destroyed, as Committee Print No. 1 does, there is no sound, saleable, and equitable way it can be rejuvenated in the form of a contract no-fault coverage.

PRIMACY OF AUTOMOBILE COVERAGE

In our testimony on the original S-945 (May 7 Statement, pp. 8-9), we objected to the fact that the bill abrogated the vitally important principle that *motoring should pay its own way* in our society. By making the mandatory no-fault economic loss coverage excess over virtually all other private or public insurance systems and benefit sources (except where those systems and sources explicitly elect to be secondary), the original S-945 would have thrust on systems outside the auto reparations system most of the accident loss costs that motoring should itself bear.

Committee Print No. 1 effects some restructuring of the provisions relating to this issue, in which the situation under original S-945 is in one regard slightly improved but in other regards worsened.⁸ On balance, our original objections are still unanswered, and we reassert them.

⁶ A somewhat analogous dilemma is presented with regard to automobile property damage. Many motorists who now do not carry first party collision coverage on their car (or one of their cars) will be faced with either (1) shouldering the full additional exposure to loss that S-945, Committee Print No. 1, creates by abolishing their right of tort recovery against one who negligently damages their car, or (2) paying the added premium to buy collision coverage. Even if the latter route is followed, when damage occurs, the car owner will still have to dig into his own pocket to pay the amount of loss represented by the deductible.

⁷ For example, by giving free to non-car owners and their spouses and dependents, the no-fault "non-economic" loss protection for which car owners must pay dearly under the same program, Committee Print No. 1 not only hands a substantial windfall to those who legitimately fall in the non-car owner class, but readily lends itself to all sorts of devices which could undermine (and perhaps destroy) the whole purpose of the bill in this regard. A highly-paid business executive could, by simply leasing a car or carrying title to his car in his company name, completely avoid buying "non-economic" loss coverage; yet, if injured, he and his family, even if at fault, could collect from the insurer of any other vehicle in the accident all the extra benefits provided in that coverage. Thus, they would be assured of collecting unlimited damages for pain and suffering, plus all their income losses (including income above the \$1,000 limit set in the basic coverage under S-945) without paying a penny for that costly protection. They would in effect thereby be subsidized by their white-collar and blue-collar neighbors who aren't in a position to employ company car, leased car, or kindred arrangements and avoid personally "owning" a car and paying for the optional coverage.

⁸ Original S-945, in defining "net economic loss" compensable under the required auto insurance coverage, called for deduction of all benefits, etc., received under any private or public insurance or plan or benefit source, except (1) life insurance, gratuities, familial support, etc., (2) where such private or public insurance or plan or benefit source explicitly makes itself excess to auto insurance benefits. Subsection 2(15) of Committee Print No. 1 redefines "net economic loss" to mean economic loss reduced only by the amount of any benefits or payments received from (A) any public health insurance or plan, and (B) any private insurance or plan explicitly making its benefits primary over benefits under a "qualifying no-fault policy" of auto insurance. The new provision as to private benefit sources represents some improvement over the original, but still an inadequate answer. The new provision as to public benefit sources is a further step in the wrong direction. Automobile insurance coverage should be primary in all situations, except that it should not apply to cases covered by workmen's compensation. (The same sort of public policy considerations dictating that motoring pay its way likewise dictate that a business enterprise bear the full social costs of accidents occurring in the course of its operations.)

Actuarial projections supplied to us by the Chairman of our Special Actuarial Committee on Costing indicate that, conservatively speaking, adoption of Committee Print No. 1 of S-945 would have the following impact on insurance premium levels:

For those motorists who now carry a full package of auto insurance coverage (BI and PD liability, collision and comprehensive, and uninsured motorist and medical payments coverage), and who under S-945, Committee Print No. 1, purchase the required basic injury coverages plus collision and comprehensive, it will mean a 10% or 30% increase in average premiums, depending on the state.

If those motorists decide also to buy the optional "non-economic loss" coverage (since S-945 abolishes their tort right of recovery for pain, suffering, etc.) it will mean a 25% to 60% increase over existing premiums.

Motorists who currently carry just the minimum auto insurance coverages¹ will fare even worse, percentagewise.

Even if they continue under S-945, Committee Print No. 1, to buy only the basic coverages it requires, their average premiums will rise *between 10% and 45%*.

If they decide to buy the optional "non-economic loss" coverage it will add 40% to 100% increase over their existing premiums.^{2a}

INEQUITABLE SHIFT IN THE ACCIDENT LOSS BURDEN

As alarming as these rate projections are, they don't even tell the whole story, for they represent only the increases in the *average* premiums for motorists with various typical packages of coverage. The increases will be even more sizeable for some categories of motorists; those who will be hit relatively the hardest will be those car owners who present the least hazard to others—such as the head of a large family who is a careful driver and the farmer with comparatively low usage of congested highways and streets.

The present system not only keeps the onus of responsibility on the guilty party, but generally speaking, operates to place most of the burden of accident losses and insurance premium costs on the shoulders of those vehicle owners and operators who create the greatest hazard. The Illinois Plan and our Dual Protection Plan preserve this sound and equitable principle. S-945 in original form would have gone a long way toward abrogating it. Committee Print No. 1 utterly destroys the principle. It in effect decrees that the less hazardous motorists shall bear the cost of totally insuring themselves against all the extraordinary injuries and damages to which they are exposed at the hands of those who present a greater than ordinary hazard—either by reason of their youth, their driving habits, or their greater usage of the highways.

TREATMENT OF PAIN AND SUFFERING AND OTHER "NON-ECONOMIC" DAMAGES

A prime example of the arbitrary and unjust way that Committee Print No. 1 of S-945 reverses responsibilities and shifts burdens is its treatment of pain and suffering and other "non-economic" damages³ as defined in the bill. All right of recovery in tort (even in "catastrophic harm" situations which original S-945 would have left under the fault system) is abolished. The system erected in its place deals as follows with non-economic losses:

1. A "car owner" and his spouse and dependents will go completely uncompensated for pain and suffering and other "non-economic" losses as defined by the bill, unless the car owner has affirmatively elected to insure himself and his family against such losses, by purchasing the optional no-fault coverage for that purpose.

2. Anyone who is not a car owner or the spouse or dependent of a car owner will on the other hand be compensated⁴ not only for economic losses, but also for pain and suffering (as measured by tort law of the state in question) and other "non-economic" losses, even where he is at fault.

¹ That is, the minimum bodily injury and property damage liability coverages and uninsured motorist coverage specified in the state financial responsibility or compulsory insurance laws.

^{2a} If such motorists also decide they now need collision coverage, since S-945, Committee Print No. 1 abolished their right to recover from a negligent third party who damages their car, it will add another 30% to 120% to their premium bill.

³ The term "damage other than economic loss" under Sec. 2(17) includes not only intangible damages, but also tangible damage in excess of "economic loss" as defined in Sec. 2(13). Wage loss above \$1,000 a month is one example of the latter.

⁴ By the insurer or insurers of the car or cars involved, or in the case of uninsured vehicles, by the assigned case plan created under the bill.

The inclusion of these provisions in Committee Print No. 1 of S-945 evidences an awareness by the drafters that, as we have long maintained, the public values highly its right to sue for intangible as well as tangible damages, and will not react kindly to having it abolished. But the supposed answer proffered by Committee Print No. 1 is really no answer at all. It not only won't satisfy the problem, but it will create vexing new problems and inequities.

For one thing, the optional non-economic loss coverage will be so costly that many motorists in the lower income brackets simply cannot afford it or will not buy it. As I have indicated, merely to buy Committee Print 1's minimum compulsory coverages alone, many motorists today paying \$100 for basic coverage will have to pay \$145. Many will refuse to pay a total of \$200, or even more in some cases, for a package including optional "non-economic loss" coverage.

Committee Print No. 1 of S-945 has thereby destroyed a vitally important right of recovery and tried to replace it with a substitute that is, practically speaking, either beyond the reach of or unsaleable to a large segment of the public.⁶

A host of other problems and imponderables too numerous to mention here are presented by the treatment given by Committee Print No. 1 to pain and suffering and other "non-economic" losses.⁷ We believe that after the right of tort recovery for intangible damages is once destroyed, as Committee Print No. 1 does, there is no sound, saleable, and equitable way it can be rejuvenated in the form of a contract no-fault coverage.

PRIMACY OF AUTOMOBILE COVERAGE

In our testimony on the original S-945 (May 7 Statement, pp. 8-9), we objected to the fact that the bill abrogated the vitally important principle that *motoring should pay its own way* in our society. By making the mandatory no-fault economic loss coverage excess over virtually all other private or public insurance systems and benefit sources (except where those systems and sources explicitly elect to be secondary), the original S-945 would have thrust on systems outside the auto reparations system most of the accident loss costs that motoring should itself bear.

Committee Print No. 1 effects some restructuring of the provisions relating to this issue, in which the situation under original S-945 is in one regard slightly improved but in other regards worsened.⁸ On balance, our original objections are still unanswered, and we reassert them.

⁶ A somewhat analogous dilemma is presented with regard to automobile property damage. Many motorists who now do not carry first party collision coverage on their car (or one of their cars) will be faced with either (1) shouldering the full additional exposure to loss that S-945, Committee Print No. 1, creates by abolishing their right of tort recovery against one who negligently damages their car, or (2) paying the added premium to buy collision coverage. Even if the latter route is followed, when damage occurs, the car owner will still have to dig into his own pocket to pay the amount of loss represented by the deductible.

⁷ For example, by giving free to non-car owners and their spouses and dependents, the no-fault "non-economic" loss protection for which car owners must pay dearly under the same program, Committee Print No. 1 not only hands a substantial windfall to those who legitimately fall in the non-car owner class, but readily lends itself to all sorts of devices which could undermine (and perhaps destroy) the whole purpose of the bill in this regard. A highly-paid business executive could, by simply leasing a car or carrying title to his car in his company name, completely avoid buying "non-economic" loss coverage; yet, if injured, he and his family, even if at fault, could collect from the insurer of any other vehicle in the accident all the extra benefits provided in that coverage. Thus, they would be assured of collecting unlimited damages for pain and suffering, plus all their income losses (including income above the \$1,000 limit set in the basic coverage under S-945) without paying a penny for that costly protection. They would in effect thereby be subsidized by their white-collar and blue-collar neighbors who aren't in a position to employ company car, leased car, or kindred arrangements and avoid personally "owning" a car and paying for the optional coverage.

⁸ Original S-945, in defining "net economic loss" compensable under the required auto insurance coverage, called for deduction of all benefits, etc., received under any private or public insurance or plan or benefit source, except (1) life insurance, gratuities, familial support, etc., (2) where such private or public insurance or plan or benefit source explicitly makes itself excess to auto insurance benefits. Subsection 2(15) of Committee Print No. 1 redefines "net economic loss" to mean economic loss reduced only by the amount of any benefits or payments received from (A) any public health insurance or plan, and (B) any private insurance or plan explicitly making its benefits primary over benefits under a "qualifying no-fault policy" of auto insurance. The new provision as to private benefit sources represents some improvement over the original, but still an inadequate answer. The new provision as to public benefit sources is a further step in the wrong direction. Automobile insurance coverage should be primary in all situations, except that it should not apply to cases covered by workmen's compensation. (The same sort of public policy considerations dictating that motoring pay its way likewise dictate that a business enterprise bear the full social costs of accidents occurring in the course of its operations.)

INSURANCE REGULATORY REQUIREMENTS

S-945 both in its original and present form constitutes a direct, clear-cut move for Federal entry into the regulation of the auto insurance business, which is now and *should remain* the province of the states. In the course of this move, the Federal Government under the bill's provision would also usurp fundamental company management prerogatives, destroy competition, initiative, and innovation in the pricing and marketing of automobile insurance, and imperil the growth and even the soundness of companies.

The printed Staff Analysis of Committee Print No. 1 contains a paragraph (p. 3) captioned "State regulatory role preserved", but upon a reading of that paragraph and inspection of the bill, it is apparent that that role is intended to be subordinate, although expensively duplicative. This bill prescribes or its administrator will dictate:

1. The scope, contents, and terms of all policies, coverages, and benefits required or permitted to be sold;
2. The grounds (lack of a license, failure to pay premiums, or impending insolvency) on which an application for basic insurance under the bill may be rejected, or a policy cancelled or non-renewed;
3. Uniform risk classes;
4. Uniform rating territories;
5. A uniform statistical plan for compiling and reporting claims and loss experience;
6. Structure and operation of the assigned claims plan in each state.

The federal insurance administrator must also be furnished with every insurer's rates for all classes and territories. He is required at least semi-annually to prepare, and make available to the state insurance commissioners and the public, comparisons of each insurer's "actual rates" with its "indicated rates" as determined by the federal administrator, for each class of risk in each rating territory.

The role intended for the state insurance commissioners under this plan is therefore clear—it is one of seeing to it that each insurer's actual rates conform to the "indicated rates" handed down from Washington. What Committee Print No. 1 adds up to is dual regulation, with the federal government duplicating complicated and extremely expensive regulatory processes already being performed adequately by the state. The countless additional millions of dollars this would cost the taxpayers annually cannot be justified. Worse than that is the destruction Committee Print No. 1's straightjacketing restrictions wreak on competition, innovation, and the healthy growth and soundness of our business. If the property and casualty insurance industry is to continue to attract risk capital and develop additional surplus to meet the market needs of an ever-expanding motoring population, it needs not more, but fewer, shackles and fetters on the pricing and marketing of its products.

In this regulatory context, the most dangerous single provision in the bill is Subsection 5(g). With but two very tenuous exceptions, this subsection would require every insurer, large or small, to accept every applicant who has a license and tenders a premium, and to insure him for life if he desires.*

What makes this provision all the more insidious is that it carries the false front of a "consumer-oriented" measure, since it purports to guarantee the availability of auto insurance at all times in a company of an individual's choice. In actuality, such a measure won't add one penny to our industry's market capacity. To the contrary, it will probably serve to constrict that overall capacity.

It should be noted that the automobile insurance industry today is *already* guaranteeing the availability of essential automobile insurance coverage to every

* The only exceptions are (1) where the domiciliary state insurance commissioner "deems in writing that the financial soundness of each insurer would be impaired by the writing of additional policies of such insurance", or (2) where the insurer ceases to write new policies of insurance of any kind in the jurisdiction of the rejected applicant.

The latter avenue, of course, means going out of business entirely in the states involved. In other words, it means committing economic suicide, especially for scores of small or medium sized companies, many of which operate in only one or a few states.

As to the first avenue, its basic flaw lies in the fact that it may prove very difficult for a company management to affirmatively prove to a regulatory official (be he state or federal) that accepting one or more additional policies will impair its financial soundness, and to obtain a timely order from such an official to such effect. The analysis of a company's overall financial soundness (in which all its assets, reserves, liabilities, etc., for all lines and areas must be examined and evaluated) is a very time-consuming process, and an insurance department has adequate staff to be examining more than a few companies at any one time.

licensed motorist who from a safety standpoint deserves to be on the highway. It is doing so collectively, through Auto Insurance Plans (assigned risk) in every state, which are undergoing constant broadening and streamlining.

We know of no other comparable industry, incidentally, that affords such a service: Banks, for example, do not provide "assigned borrower's" plans where a poor credit risk can go and get a loan without collateral.

As though our industry's collective guarantees of insurance availability were not enough, Committee Print No. 1 seeks to force every automobile insurance company in America to *individually* guarantee, in effect, that it will accept and insure *perpetually* every customer who walks in, to the point where it reaches the brink of insolvency. This utterly unreasonable (and possibly unconstitutional) requirement is unprecedented in the annals of American business.¹⁰ It will destroy competition, forestall entry of new risk capital into our industry, force scores of smaller companies out of business, and force many who remain to seek higher rates. In practice, this would be an anti-small business measure.

CONCLUSION

For these and other reasons, our Association is strongly opposed to S. 945, both as originally introduced and as revised in Committee Print No. 1. It is our position that no Congressional legislation of any kind relating to the no-fault issue is needed or warranted, either creating a federal system as these bills would do or seeking to superimpose a single, preconceived pattern on all the states. Federal legislation will stifle the needed experimentation that is so vital to sound auto insurance reform. The states are on the move in the consideration and adoption of modified no-fault programs that constitute a great step forward, but do not involve added costs or risks, or the sacrifice of accident victims' basic rights.

We are doing everything possible to aid in that effort. We are convinced that the state avenue is the only avenue which affords the flexibility and adaptability essential for testing and perfecting a modernized reparation system that will best satisfy the long-range, diverse demands of the motoring public.

OCTOBER 19, 1971.

MR. ARTHUR C. MERTZ,
Vice President and General Counsel, National Association of Independent Insurers, Washington, D.C.

DEAR MR. MERTZ: When you appeared before the Senate Commerce Committee on October 13th, you were asked if you would provide for the record answers to any written questions submitted to you. You kindly consented to this request, and I am, therefore, submitting the following question to you:

Would you please provide the Committee with a detailed actuarial analysis of the costs of Committee Print One for an average person (average age, territory, driving record, and so forth) and state the benefits resulting from such qualifying no-fault policy? Would you then compare the costs and benefits of the qualifying no-fault policy with costs and benefits of bodily injury liability coverage (10-20) for the same person? When presenting such information, please disclose the assumptions upon which your actuarial projections are based and indicate the pure loss, the loss adjustment expense, acquisition, and other costs of the "qualifying no-fault policy" premium dollar.

Thank you very much for your cooperation. The Committee will close its hearing record on October 28, 1971.

Sincerely yours,

WARREN G. MAGNUSON, Chairman.

¹⁰ Even the example of a public utility is in no way analogous. The business risks and hazards faced by a utility cannot even approach those of a casualty insurer, because (1) the utility has a monopoly while an insurer faces widespread competition; (2) the utility sells a product whose cost is known at time of sale while an insurer never knows the true cost of its product (or the full scope of its exposure to loss); (3) the utility can fairly readily ascertain when it has used up its capacity so as to excuse it from accepting additional customers, while it is difficult for an insurer (or regulator) to define the exact point when acceptance of additional insureds will exceed a safe limit; and (4) most important, a utility is assured a fixed profit on its assets, while insurers are not assured any profits nor is there any way a profit could be assured to the members of an industry made up of hundreds of competing entrepreneurs. Yet Committee Print No. 1 would saddle automobile insurers with obligations of acceptance and retention of customers which exceed in severity those imposed on utilities.

ALLSTATE,
Northbrook, Ill., October 29, 1971.

HON. WARREN G. MAGNUSON,
*Chairman, Senate Committee on Commerce, New Senate Office Building,
Washington, D.C.*

DEAR SENATOR MAGNUSON: This is in reply to your letter of October 19 addressed to Mr. Arthur C. Mertz of the National Association of Independent Insurers. Since your question deals with a matter of costing no-fault insurance, Mr. Mertz has referred the inquiry to me for reply. To identify myself, I was the gentleman introduced by Mr. Mertz as seated at his elbow at the hearing on October 13. I am an Actuary with the Allstate Insurance Company and have been for some time Chairman of an Actuarial Sub-Committee of the National Association of Independent Insurers on the costing of no-fault auto insurance plans.

In order to give a direct reply to the question contained in the second paragraph of your letter, I must explain that our costing estimates are given on the basis of three principal combinations of coverage which the purchaser of automobile insurance normally buys. This method of making comparisons in costs was established some time ago and is based on our knowledge that the consumer makes his cost comparisons between the total premiums paid this year and the total premiums paid last year. Seldom does he analyze the combinations of coverage into their respective elements.

Minimum coverage is defined as Bodily Injury, Property Damage, and Uninsured Motorists Coverage. Medium coverage is minimum coverage plus first party medical coverage. Full coverage is medium coverage plus collision and comprehensive.

The recent Department of Transportation study reveals that something in excess of 20% of American motorists do not carry insurance at all. With respect to these individuals it is obvious that any plan (such as the proposed National No-Fault Motor Vehicle Act) which is compulsory, will increase the cost of these uninsured motorists by a ratio equivalent to infinity.

It is fair to assume for purposes of your comparisons, that the remaining motorists—those who do purchase insurance—may be distributed in roughly the following proportions:

| | Percent |
|-----------------------|---------|
| Full coverage----- | 70 |
| Medium coverage----- | 10 |
| Minimum coverage----- | 20 |

With this explanation we can now reply to your question as follows: an average Allstate policyholder (on a country-wide basis) pays approximately \$96 a year if he buys minimum coverage, \$107 a year if he buys medium coverage, and \$181 a year if he purchases full coverage (as most people do).

A person purchasing minimum coverage might expect an increase in his total cost of 29.7% if he elected not to buy the optional Personal Injury coverage, and an increase of 88.6% if he did elect the optional Personal Injury coverage (where such coverage was applicable only to accidents involving the insured vehicle).*

A person purchasing medium coverage might expect an increase in his total cost of 15.8% if he elected not to buy the optional Personal Injury coverage, and an increase of 68.4% if he did elect the optional Personal Injury coverage (where such coverage was applicable only to accidents involving the insured vehicle).*

A person purchasing full coverage might expect an increase in his total cost of 18.0% if he elected not to buy the optional Personal Injury coverage, and an increase of 49.2% if he did elect the optional Personal Injury coverage (where such coverage was applicable only to accidents involving the insured vehicle).*

The above actuarial estimates are based upon a computer program which has been applied extensively in the costing of many types of no-fault plans across the entire country. The method has been reviewed by many actuaries including those employed by members of all three of the major trade associations as well as actuaries employed by State Insurance Departments. It has been regarded consistently as a valid method for measuring the many alternate compensation plans proposed.

*Of course there are considerable state by state variations, as explained by Mr. Mertz in his testimony on October 13.

It is virtually impossible to detail all of the assumptions and statistics which underlie the final result. The computer program itself would be one starting point, but even this rather sophisticated program relies upon tables of underlying statistical information which occupy shelves of space in our company files.

As an indication of the type of work we have done, we enclose a description of that portion of our costing approach which deals with the question of frequency of occurrence of claims under the present tort system and again under the no-fault approach. You may or may not desire to include this enclosure as part of the record of testimony.

The balance of our analysis dealing with the relative severity (average cost) of individual claims is available in numerous compilations of tables which are available for discussion with you or your staff, but which are so bulky that they can hardly be made a part of this reply.

The analysis relies upon many sources:

1. Statistics from the United States Public Health Survey.
2. The Department of Transportation "Closed Claim" survey, also identified as "Automobile Personal Injury Claims."
3. Motor vehicle statistics from various State Motor Vehicle Departments, including particularly those of Illinois, New York, and California.
4. Research done at Allstate's Judson Branch Research Center in Menlo Park, California.
5. An individual "Closed Claim" survey done by Allstate in August of 1969.
6. Results of the Guaranteed Benefits Experiment conducted by the American Mutual Insurance Alliance with the help of several nonmember companies participating voluntarily.
7. Remarks contained in the publication "Orisis in Car Insurance," University of Illinois Press (1968).
8. A number of technical articles in the Proceedings of the Casualty Actuarial Society.

And many other sources available to the writer such as the Statistical Bulletin of the Metropolitan Life Insurance Company. In addition, the writer benefitted from a beginning to end participation in the Department of Transportation Closed Claim Survey.

The writer of this letter is available for consultation with you and/or members of your staff and/or any actuarial help you might retain to go into each and every detail of the collection of data, and calculations therefrom, including assumptions used to arrive at the final estimate.

To the best of our knowledge this is the most complete and up to date information available anywhere for costing no-fault insurance proposals. It contrasts markedly with the 1968 Study of the American Insurance Association which is generally regarded by most actuaries as being out of data and seriously flawed in a number of respects:

1. Since the 1968 AIA Study, a vast amount of additional information has become available, notably the two statistical studies by the DOT—Automobile Personal Injury Claims, and Economic Corporation of Automobile Accident Injuries.
2. The method of sampling used as a basis for the AIA Study would not have been acceptable to those who administered the DOT's two Studies referred to above.
3. The Closed Claim Study produced 27,500 Bodily Injury claims from 16 company groups in 19 key states, whereas the AIA Study produced only 4,000 Bodily Injury claims from 12 company groups in 7 states. Whereas the AIA Study was done only by stock member companies of the AIA and did not include the experience of the two major automobile insurers, the DOT Closed Claim Survey included all of the ten largest automobile insurers representing stocks, mutuals, and reciprocal exchanges, both bureau and independent.
4. It is impossible to reconcile the conclusion from the AIA Study that 79% of all injured persons recover under the present tort system with the conclusion from the DOT Seriously Injured Study that less than 45% of all seriously injured persons recover through the operation of the tort system. The effect of this disparity in arriving at cost estimates when going from a tort liability system to a no-fault system should be apparent even to an individual who has not studied this matter at great length.
5. It has been pointed out in a published report by the American Mutual Insurance Alliance that the AIA Study fails to recognize the cost implication of death benefits to dependents after the time that the injured person dies.

In contrast with the AIA testimony given on October 14, it should be pointed out that the costing analysis underlying the estimates given above results from a careful and detailed study of Committee Reprint No. 1, and not on the general assumption that Committee Reprint No. 1 is just another version of the AIA plan which was costed four years ago.

The costing estimates given here are based on the assumptions that the relationship between pure lost cost and all other items of expenses remains the same. It is probable that any change in the system for compensating persons injured in automobile accidents will affect this relationship, but such change, whether upward or downward, is not expected to change the premium to the consumer markedly.

We hope the above is of help to you and your Committee, and hold ourselves available to you and your staff for further testimony, inquiry, or discussion.

Yours very truly,

CHARLES C. HEWITT, JR.

**STATEMENT OF ANDRE MAISONPIERRE, VICE PRESIDENT AND
MANAGER, AMERICAN MUTUAL INSURANCE ALLIANCE, WASH-
INGTON, D.C.**

MR. MAISONPIERRE. Thank you, Mr. Chairman. We appreciate very much the opportunity of presenting our views this afternoon on Committee Print No. 1 of S. 945. We would very much appreciate if our statement and appendixes could be made part of the record. Because of its length we will summarize it at this time.

Senator BAKER. Thank you very much. It will be received without objection and incorporated in the record appropriately.

I. INTRODUCTION

MR. MAISONPIERRE. My name is Andre Maisonpierre and I am vice president of the American Mutual Insurance Alliance, a national association of mutual property and casualty insurance companies. Our member companies provide automobile and other property-casualty coverage in all 50 States and the District of Columbia.

We would appreciate if our statement and appendixes could be made part of the record. Because of its length, we will summarize it at this time.

It has been suggested that our testimony today be restricted to a technical analysis of Committee Print No. 1. We want it clearly understood, however, that the Alliance continues to be unalterably opposed to a national no-fault solution. Our prior testimony before this committee detailed the reasons for this opposition and nothing has happened in the interim which would make us change our views. In fact, we are more convinced than ever that the States are demonstrating their willingness to come to grips with automobile accident compensation reform.

Any piece of legislation, be it auto reform, tax reform, State or Federal, must be measured against well set-out objectives. In our complicated world, it is seldom sufficient to meet one or two limited objectives for reform. All must be met in order to structure the balanced approach which insures fair and equitable treatment of all.

The Alliance believes that any responsible auto insurance reform must achieve a reasonable balance among five different and often contradictory goals:

1. To provide crash victims with prompt and fair compensation
2. To encourage driver accountability.

3. To keep overall costs at a reasonable level.
4. To equitably allocate the cost burden.
5. To relieve court congestion.

Let us see now how the committee print meets these objectives of responsible reform.

II. TO PROVIDE CRASH VICTIMS WITH PROMPT AND FAIR COMPENSATION

Our prior testimony stressed the reasons why we believe it is imperative to retain some element of general damages within a reparations system. The public opinion surveys which have been made demonstrate without a doubt that innocent automobile accident victims expect to get paid for their permanent impairments in addition to their economic losses.

Print No. 1 does, in fact, recognize the merits of this point. It provides that policyholders would be offered on a no-fault basis, reimbursement for such losses. The committee staff analysis advises us that "the controversy over whether the public wants to recover for intangible losses would be resolved by free market forces rather than by legislative determination."

What the committee print does not tell us is that because of the way it is structured, the cost of this coverage is likely to be so prohibitive that only those with large disposable incomes will be able to afford the protection. This doesn't mean, of course, that the people who cannot afford that protection do not suffer when involved in accidents and do not care to be compensated for permanent, disabling injuries. It just means that they are not able to afford to be compensated for such losses. We believe that this discriminatory approach in the treatment of auto accident victims fails to meet the objective of "fair compensation."

Let's take a closer look at some of the implications that flow from the decision to pay auto accident victims only for their net economic loss.

Envision, if you will, an accident in which a speeding motorist crosses a center line and involves another car in a serious crash. The car that was hit contains a retired couple living on social security and a pension from his former employer. They are also covered by medicare. They had planned to spend their years of retirement visiting their grandchildren and pursuing such interests as gardening, fishing, and the usual things retired people look forward to. Both suffer crippling injuries which would make it impossible for them to do any of these things.

Under the kind of reparation system envisioned in Print No. 1, this elderly couple would receive no compensation at all from the negligent driver, and would receive little if any compensation from their own compulsory automobile insurance policy. They have no income loss, and their medical expenses are largely covered by medicare. They would be able to pay the rent and put food on the table from their own resources. But there will be little money available for the amenities which might replace the enjoyment they have been forced to forego. They wouldn't even be able to collect for the damage which the negligent driver had done to their car, unless they had purchased their own

collision insurance, at a price higher than the present cost. Even then they would have to pay the first \$50 or \$100 deductible.

The negligent driver himself is a self-employed professional person who earns \$20,000 a year. He also has considerable assets in the form of real estate and stock investments which produce a net income of about \$5,000 a year. What benefit would he receive under the reparation system proposed under Committee Print No. 1? All of his medical expenses would be paid and, since he is not able to pursue his career for the period of 1 year, he would receive \$12,000 in benefits. There is no deduction for the income he receives from other sources.

What equitable principle was used in determining that a man who earns \$20,000 a year should have a substantial portion of his income replaced, while the retired couple receives nothing at all for the damage to their automobile—a serious economic loss to this couple—and nothing at all for their physical impairments which have deprived them of their retirement years? To put the question another way, what are you really replacing when you replace discretionary income beyond the amount required for basic necessities and a decent living? In essence, you are restoring the victim's ability to enjoy a style of life which such discretionary income makes possible. But isn't this also what you are doing when you make payment for general damages under the present liability system for injuries which deprive a person of mobility or in some other manner interfere with his enjoyment of life?

Those who would eliminate payment for general damages have attempted to imply that the inequities which would result are confined to rare instances. But the inequity of eliminating payment for general damages is by no means confined to the rare or bizarre case. More than 55 percent of the persons injured in automobile accidents are nonwage earners—housewives, minor children, retired persons, the unemployed, et cetera. Another substantial proportion of those injured are persons earning only a subsistence level of income or not far above it. If the system fails to provide anything other than net economic loss, is it not discriminating against this large group of auto accident victims? And are they not the group least likely to have purchased any optional benefits which would provide amenities to replace the enjoyment destroyed by the injury? People who have been injured by a negligent driver expect to get paid for their trouble, pain, and inconvenience. Those who have suffered a permanent impairment are even less likely to be satisfied with being paid nothing more than their net economic losses.

III. ACCOUNTABILITY

As I read through the committee print and its report and tried to visualize how the new system would work in practice, I had an uneasy sensation that the world envisioned in this proposal is an unreal world. It is a neat, logical world where the decisions how to treat people are going to be based on economic values alone. It is a world in which people presumably would look upon an injury inflicted by a negligent driver as strictly a random event, devoid of emotion and personal significance beyond the dollars involved. It is a mechanized, dehumanized world which recognizes neither the moral responsibilities of drivers nor the psychological needs of crash victims. **Most of all, it**

is a world in which human values have been sacrificed to cost efficiency concepts.

Somewhere along the line, the proposal loses sight of the fact that man is not entirely rational, not entirely economic, but is a creature with emotional and psychological needs as well. These needs cannot always be logically articulated. But these are nevertheless real and must be dealt with in designing any future reparation system.

What we have been offered is a system which attempts to meet the accident victim's economic needs but which ignores his sense of justice.

It seems odd that at a time when government is pressing the theme of accountability—and this committee particularly, having specifically addressed itself to the field of accountability in its warranty legislation, class action legislation, product safety legislation, et cetera—would back away from accountability when it relates to automobile crashes.

Committee Print No. 1 would impose a reparation philosophy on our society which runs counter to the expectations of accident victims. In a democratic society, such an imposition cannot be a lasting one.

IV. Costs

In evaluating any important change in a social or economic structure which involves most of us, it is not only highly desirable but well nigh essential that we have a fix on the cost of the new procedure as compared to the program it will replace.

The Alliance Actuarial staff, assisted by the Alliance Actuarial Committee, has attempted to project the bodily injury coverage cost of Committee Print No. 1.

It must be understood that costing of a proposed program which is radically different than anything now in operation poses many problems, that it involves any number of assumptions, and that the answer is at best only an approximation.

A. COMPULSORY ECONOMIC LOSS COVERAGE

Using a number of assumptions necessitated by the vagueness of the bill with respect to benefits, and making conservative estimates of increased frequency, we estimate that the average premium cost of the compulsory bodily injury coverages will be at least 37 percent greater than current bodily injury liability premiums. In other words, for every \$100 paid today by an automobile policyholder for bodily injury and uninsured motorist coverage (\$10,000 per person and \$20,000 per accident), that same policyholder will pay \$137 for the compulsory economic loss coverage under Committee Print No. 1.

B. OPTIONAL INTANGIBLE DAMAGE BENEFIT

The Department of Transportation's Economic Consequence of Accidents Study revealed that 53 percent of auto accident victims are not paid by today's tort system. This large group is composed of individuals injured in single-car crashes as well as those whose injuries arise out of their own negligence.

Committee Print No. 1 would pay all covered injured their full intangible losses. Hence, as related to covered policyholders, one should expect the cost of this coverage to be double that which such policyholders presently pay for intangible loss protection under the present insurance system.

Today, for every \$100 of bodily injury premium cost, \$60 is allocated for intangible loss. Hence, for every \$100 of today's total bodily injury premium cost, this new insurance protection will cost policyholders 20 percent more than what they pay today for bodily injury insurance coverage.

C. PROPERTY DAMAGE

It has been claimed that eliminating fault as a basis for recovery of damages to automobiles, one can dispense with property damage liability and thus achieve substantial cost savings. This just is not so.

In considering the cost to an individual motorist, one must consider not only the price he pays for purchasing insurance coverage, but also the out-of-pocket costs which he must absorb.

Eliminating fault as a basis for recovery does not eliminate the losses incurred in accidents. Committee Print No. 1 would merely require that each car owner bear his own losses, regardless of how his car was damaged.

Those who now feel comfortable doing without collision coverage because of the control they exercise over accidents, are forced by Committee Print No. 1 to make an agonizing reappraisal and a cruel choice: either elect against purchasing the coverage and leave themselves open to a very substantial loss or to purchase the proposed coverage. This serves to reduce the potential exposure to loss—although the insured will still have to absorb the deductible when involved in an accident.

Hence, what Committee Print No. 1 accomplishes by eliminating fault as a basis for recovery to damaged automobiles is forcing automobile owners to either self-insure their own losses or to purchase collision insurance at a substantially higher cost than today's coverage.

D. CONCLUSION

In conclusion, we project that for every \$100 spent under today's system for bodily injury coverage, a policyholder will spend \$257 for Committee Print No. 1's full bodily injury protection.

V. EQUITABLE ALLOCATION OF COST BURDEN

A major impact of Committee Print No. 1 on our society will be a redistribution of who will bear what losses. Committee Print would require that accident *victims* pay the greater share of the total incurred automobile accident losses. The present system, on the other hand, bears down hardest on those who have *caused the losses*, on the theory that as a matter of equity, good drivers should not subsidize those who abuse the privilege of driving.

More specifically, Committee Print No. 1 would bring about a wind-fall to two large groups of vehicle users—truck owners and owners of muscle cars. Let us see how each of these groups would fare under the proposal.

Truck owners would have no responsibility whatsoever for injuries arising on the highway except to their own employees riding in their trucks. The fact is that today they already have this responsibility. Full medical benefits and most wage losses are covered and have been covered for many many years by workmen's compensation laws. Thus, Committee Print No. 1 does not impose any new liability or responsibility or cost on the truck owners, while removing much of the responsibility and liability and cost which the present auto reparation system imposes on them. Passenger cars are being asked to subsidize the truckers' use of the road.

The owners of high-powered automobiles also would benefit substantially from Committee Print No. 1. As we testified earlier, there is sound statistical evidence indicating that muscle cars cause more accidents and more serious injuries than other private passenger automobiles. The existing compensation mechanism allows this to be reflected in the price which the owners of such cars must pay for insurance. In fact, it is the high cost of insurance which is being blamed by automobile manufacturer executives for the drastic drop in the sale of these cars.

Committee Print No. 1 would force a dramatic change. Most of these cars are owned by young people with little if any family responsibilities. When involved in accidents, these young people have little if any wage losses and, their medical expenses are below average because of the ability of their young bodies to heal quickly. Hence, an insurance system which is predicated on the amount of benefits paid to a victim and not on the losses caused would greatly benefit these people. There would be a two-fold result. On the one hand, the reduced accident and severity rate brought about by the sharp decrease in the number of muscle cars on the road will be reversed. Second, the increased accident costs resulting from the reckless operation of muscle cars would not be paid by the muscle-car owners themselves but, again, by the large body of passenger-car owners. We believe that this shift in cost is not only inequitable but clearly against public interest.

Again, let me stress that Committee Print would restructure the cost burden of automobile accidents by requiring the accident victims to subsidize the reckless driver. It would be difficult, if not impossible, to devise an acceptable merit rating plan under a system based on categorical rejection of the fault concept.

Committee Print No. 1 would restrict the payment of benefits to the extent that the loss exceed, among others, recovery from any "public health insurance plan." Hence, again, although we agree with the need to prevent duplication, we see little justification for switching the cost of automobile accidents from the users of the highway to the general tax base.

Not only is it undesirable, from a standpoint of public policy, to hide the cost of automobile accidents within the general tax structure—as Committee Print No. 1 would do—but a major advantage of first-party automobile insurance would be eliminated. It should be remembered that an important reason given by no-fault automobile insurance supporters is the saving of the dollars which would have to be brought to bear the rehabilitation expenses of motor accident victims had been done for the victims' compensation benefits. We agree with this point and it is for this reason that we are recommending

ing a minimum of \$50,000, first-party automobile coverage in our guaranteed protection plan. We are convinced that the rehabilitation of the traumatically injured can best be undertaken at the direction of those institutions that specialize in managing traumatic medicine. We do not believe that if the care and responsibility for the treatment of automobile accident victims is left in the hands of those who have responsibility for the total medical care of our citizens, that the type of rehabilitative techniques best suited to traumatic case specialties will be applied.

In conclusion, it is obvious that Committee Print No. 1 falls far short of equitably allocating the cost burden of automobile accidents.

VI. COURT CONGESTION

Committee Print No. 1 raises many questions about the extent of coverage to be provided which will need to be answered by the courts, in some instances, on a case by case basis. For instance:

- a. What is the term "accidental harm" intended to cover?
- b. Does the term "operation, maintenance, or use" intend to include injuries received while washing a car, working on it, and so forth? If someone suffers a slipped disc while unloading a bag of fertilizer from the trunk of his car, is this intended to be covered?
- c. If the policyholder backs over his son's bicycle, is it intended that the proposed new policy pay for it?

Our claims people foresee major difficulties and legal controversy in determining what to pay large numbers of auto accident victims for their income loss. The bill proposes to pay actual earning loss as well as expected future earning loss. Many of the 55 percent of the non-wage-earner accident victims expect to enter or reenter the work force at some future date, or to earn supplementary income in some way. How is their claim going to be handled under a system which provides no yardstick for measuring the amount of a loss, and which does not provide for any payment until the loss has already occurred? These problems are present today from the claim viewpoint but they would be greatly exacerbated under a system with no policy limits and no apparent means of reaching a settlement other by obtaining a court order.

The reopening of old cases could be a very troublesome problem. The open-ended nature of unlimited liability imposed on the insurer would require the company to keep open its claims files indefinitely. This also would raise questions about the adequacy of loss reserves.

The system as proposed in Committee Print No. 1 would provide many opportunities and incentives for overutilization of benefits and even outright fraud.

All these uncertainties and complications will develop substantial friction between policyholders and their insurers and will need to be resolved by the courts. Rather than lessening the burden on the courts it is suggested that Committee Print No. 1 will increase it.

In fact, it is apparent that it is contemplated that policyholders will avail themselves frequently of professional, legal expertise. The bill encourages victims to seek legal representation by requiring the insured to pay additional attorney fees in all claims other than those found by the courts to have been frivolous. Thus, even though a claim

may be denied by the courts, unless the court, also found the claim to have been frivolous, an attorney fee would have to be paid by the company.

All in all, Committee Print No. 1 will encourage rather than discourage auto victims, their attorneys, and insurance companies to seek the help of the court to resolve disputes under the system.

VII. CONCLUSION

The following points up some of the basic weaknesses in the structure of Committee Print No. 1:

1. The bill would be expensive and discriminatory for the consumer.
2. It would needlessly and expensively complicate underwriting and claim administration.
3. The bill unfairly shifts the cost burden of automobile accidents from truckers and irresponsible drivers to careful passenger car owners.
4. The bill is inconsistent and ambiguous.
5. The bill eliminates all elements of personal accountability.
6. Like its predecessor, S. 945, the bill would permit Federal preemption of automobile insurance regulations.

Finally, and more precisely, Federal reform of the automobile compensation insurance system just is not needed. There is overwhelming evidence that reform is underway at the State level, and the State legislatures should be given the opportunity to take such action which they believe is in the best interest of their constituencies.

Senator BAKER. I will put to you the same question that I believe we put to each of the previous witnesses.

Would you be agreeable to answering additional questions for the record as they may be submitted?

Mr. MAISONPIERRE. Yes; of course, I will, Senator.

Senator BAKER. With that, I will reserve anything further I may have at this time and use that format.

Thank you for your statement. It is a very meaningful one.

I. INTRODUCTION

My name is Andre Maisonnier and I am Vice President of the American Mutual Insurance Alliance, a national association of mutual property and casualty insurance companies. Our member companies provide automobile and other property-casualty coverages in all fifty states and the District of Columbia.

We welcome this opportunity to discuss Committee Print Number One -- S.945. For the sake of clarity, whenever S.945 is mentioned, it will refer to the original National No-Fault Motor Vehicle Insurance Act and, whenever Print One is mentioned, it will refer to Committee Print Number One, S.945.

It has been suggested that our testimony today be restricted to a technical analysis of Committee Print Number One. We want it clearly understood, however, that the Alliance continues to be unalterably opposed to a national no-fault solution. Our prior testimony before this Committee detailed the reasons for this opposition and nothing has happened in the interval which would make us change our views. In fact, we are more convinced than ever that the states are demonstrating their willingness to come to grips with automobile accident compensation reform. The Alliance is proud of the role it is privileged to play

I. INTRODUCTION

My name is Andre Maisonnier and I am Vice President of the American Mutual Insurance Alliance, a national association of mutual property and casualty insurance companies. Our member companies provide automobile and other property-casualty coverages in all fifty states and the District of Columbia.

We welcome this opportunity to discuss Committee Print Number One -- S.945. For the sake of clarity, whenever S.945 is mentioned, it will refer to the original National No-Fault Motor Vehicle Insurance Act and, whenever Print One is mentioned, it will refer to Committee Print Number One, S.945.

It has been suggested that our testimony today be restricted to a technical analysis of Committee Print Number One. We want it clearly understood, however, that the Alliance continues to be unalterably opposed to a national no-fault solution. Our prior testimony before this Committee detailed the reasons for this opposition and nothing has happened in the interval which would make us change our views. In fact, we are more convinced than ever that the states are demonstrating their willingness to come to grips with automobile accident compensation reform. The Alliance is proud of the role it is privileged to play

in assisting state legislatures in structuring reform. We are continuing to press for state enactment of our Guaranteed Protection Plan which was carefully detailed in our prior testimony. Its outlines are again attached to this statement (Appendix A).

If we appear negative today, it is for two reasons: In the first place, we have been asked to limit our comments to Committee Print Number One. Hence, we will refrain from describing to the Committee the positive steps we have taken along the road to reforms in the different states. Secondly, we believe that although Committee Print One substantially differs from S.945, it does not solve the philosophical and practical shortcomings we described in our early testimony before this Committee. On the contrary, Committee Print One has added inequities which, if enacted, would prove to be expensive and discriminatory for consumers. Hence, we look upon Committee Print Number One as a step backwards and certainly not an improvement over S.945.

Any piece of legislation, be it auto reform, tax reform, state or federal, must be measured against well set out objectives. In our complicated world, it is seldom sufficient to meet one or two limited objectives for reform. All must be met in order to structure the balanced approach which ensures fair and equitable treatment of all.

The Alliance believes that any responsible auto insurance reform must achieve a reasonable balance among five different and often contradictory goals:

1. To provide crash victims with prompt and fair compensation.
2. To encourage driver accountability.
3. To keep overall costs at a reasonable level.
4. To equitably allocate the cost burden.
5. To relieve court congestion.

Let us see now how the Committee Print meets these objectives of responsible reform.

II. TO PROVIDE CRASH VICTIMS WITH PROMPT AND FAIR COMPENSATION

For all practical purposes, the bill restricts the benefits to be paid to an automobile accident victim to his medical losses, a portion of his wage losses, and, for those who have purchased collision insurance, a portion of the expenses a policyholder has incurred as a result of his automobile being damaged.

The bill specifically prohibits benefit payments for general damages, permanent disability, amputation, disfigurement, etc., unless the policyholder himself purchases separate insurance protecting him against such losses.

Our prior testimony stressed the reasons why we believe it is imperative to retain some element of general damages within a reparation system. The public opinion surveys which have been made demonstrate without a doubt that innocent automobile accident victims expect to get paid for their permanent impairments in addition to their economic losses.

Print Number One does, in fact, recognize the merits of this point. It provides that policyholders would be offered, on a no-fault basis, reimbursement for such losses. The Committee Staff Analysis advises us that "the controversy over whether the public wants to recover for intangible losses would be resolved by free market forces rather than by legislative determination."

What the Committee Print does not tell us is that because of the way it is structured, the cost of this coverage is likely to be so prohibitive that only those with large, disposable incomes will be able to afford the protection. This doesn't mean, of course, that people who can not afford that protection do not suffer when involved in accidents and do not care to be compensated for permanent, disabling injuries. It just means that they are not able to afford to be compensated for such losses. We believe that this discriminatory approach in the treatment of auto accident victims fails to meet the objective of "fair compensation."

Let's take a closer look at some of the implications that flow from the decision to pay auto accident victims only for their net economic loss.

Envision, if you will, an accident in which a speeding motorist crosses a center line and involves another car in a serious crash. The car that was hit contains a retired couple living on social security and a pension from his former employer. They are also covered by Medicare. They had planned to spend their years of retirement visiting their grandchildren and pursuing such interests as gardening, fishing, and the usual things retired people look forward to. Both suffer crippling injuries which would make it impossible for them to do any of these things.

Under the kind of reparation system envisioned in Print One, this elderly couple would receive no compensation at all from the negligent driver, and would receive little if any compensation from their own compulsory automobile insurance policy. They have no income loss, and their medical expenses are largely covered by Medicare. They would be able to pay the rent and put food on the table from their own resources. But there will be little money available for the amenities which might replace the enjoyment they have been forced to forego. They wouldn't even be able to collect for the damage which the negligent driver had done to their car, unless they had purchased their own collision insurance, at a price higher than the present cost. Even then they would have to pay the first \$50 or \$100 deductible.

The negligent driver himself is a self-employed professional person who earns \$20,000 a year. He has a hospitalization policy, but no income coverage. However, he does have considerable assets in the form of real estate and stock investments which produce a net income of about \$5,000 a year. What benefit would he receive under the reparation system proposed under Committee Print One? All of his medical expenses would be paid and, since he is not able to pursue his career for the period of one year he would

receive \$12,000 in benefits. There is no deduction for the income he receives from other sources.

What equitable principle was used in determining that a man who earns \$20,000 a year should have a substantial portion of his income replaced, while the retired couple receives nothing at all for the damage to their automobile -- a serious economic loss to this couple -- and nothing at all for their physical impairments which have deprived them of the enjoyment of their retirement years? To put the question another way, what are you really replacing when you replace discretionary income beyond the amount required for basic necessities and a decent living? In essence, you are restoring the victim's ability to enjoy a style of life which such discretionary income makes possible. But isn't this also what you are doing when you make payment for general damages under the present liability system for injuries which deprive a person of mobility or in some other manner interfere with his enjoyment of life?

Those who would eliminate payment for general damages have attempted to imply that the inequities which would result are confined to rare instances. It is possible, of course, to find bizarre cases under any system which could be devised. But the inequity of eliminating payment for general damages is by no means confined to the rare or

bizarre case. More than 55% of the persons injured in automobile accidents are non-wage earners -- housewives, minor children, retired persons, the unemployed, etc. Another substantial proportion of those injured are persons earning only a subsistence level of income or not far above it. If the system fails to provide anything other than net economic loss, is it not discriminating against this large group of auto accident victims? And are they not the group least likely to have purchased any optional benefits which would provide amenities to replace the enjoyment destroyed by the injury?

It is argued that general damages should be excluded from compensation because they are subjective in nature and are not susceptible of objective measurements in dollars. As we have already pointed out to the Committee, this is true of a great many things in this world. How much, for instance, is a man's time worth and how is its value determined? Why do we pay a higher wage for overtime, night work and holidays and how is a differential arrived at?

How do we determine the value of a piece of real estate condemned for a highway?

All of these things are subjective in nature. Yet we manage to translate them into dollar amounts by a process of bargaining and compromise. Our society not only is capable

of translating subjective values into dollars -- it insists upon it, and considers it one of the distinguishing features of a democratic society.

Auto accident victims insist upon it also. People who have been injured by a negligent driver expect to get paid for their trouble, pain and inconvenience. Those who have suffered a permanent impairment are even less likely to be satisfied with being paid nothing more than their net economic losses.

III. ACCOUNTABILITY

As I read through the Committee Print and its report and tried to visualize how the new system would work in practice, I had an uneasy sensation that the world envisioned in this proposal is an unreal world. It is a neat, logical world where the decisions how to treat people are going to be based on economic values alone. It is a world in which people presumably would look upon an injury inflicted by a negligent driver as strictly a random event, devoid of emotion and personal significance beyond the dollars involved. It is a mechanized, dehumanized world which recognizes neither the moral responsibilities of drivers nor the psychological needs of crash victims. Most of all, it is a world in which human values have been sacrificed to cost efficiency concepts.

Somewhere along the line, the proposal loses sight of the fact that man is not entirely rational, not entirely economic, but is a creature with emotional and psychological needs as well. These needs can not always be logically articulated. But these are nevertheless real and must be dealt with in designing any future reparation system.

What we have been offered is a system which attempts to meet the accident victim's economic needs but which ignores his sense of justice.

Whatever shortcomings the present auto reparations system has -- and we agree that there are some -- it is based on some fundamental concepts which are not as outmoded as its critics think. One of them is the concept that a driver who negligently inflicts injury and monetary loss should be held accountable for the damage that he has caused. Committee Print Number One totally eliminates this concept.

Let us see how the decision to abolish driver responsibility would operate in practice.

A car is stopped at a red light, at an intersection, waiting for the control signals to turn green before proceeding. Another car careening down the road is unable to negotiate a timely stop and rams into the rear of the stopped automobile, which sustains \$550 damage. The negligent driver, if he has any social grace at all, may tell the driver of the damaged car -- "sorry, social error." But, he hasn't legally have to do anything. Under Committee Print Number One he could just as well back up his car a few feet, and go on his merry way. The fact is that this negligent driver has no responsibility whatsoever to the person whose car he has damaged. Under the Committee Plan, the driver of the damaged car, if he has not previous collision liability, will have to pay for the total repair of the car damaged and, when it

These needs can not always be logically articulated. But these are nevertheless real and must be dealt with in designing any future reparation system.

What we have been offered is a system which attempts to meet the accident victim's economic needs but which ignores his sense of justice.

Whatever shortcomings the present auto reparations system has -- and we agree that there are some -- it is based on some fundamental concepts which are not as outmoded as its critics think. One of them is the concept that a driver who negligently inflicts injury and monetary loss should be held accountable for the damage that he has caused. Committee Print Number One totally eliminates this concept.

Let us see how the decision to abolish driver responsibility would operate in practice.

A car is stopped at a red light, at an intersection, waiting for the control signals to turn green before proceeding. Another car careening down the road is unable to negotiate a timely stop and rams into the rear of the stopped automobile, which sustains \$550 damage. The negligent driver, if he has any social grace at all, may tell the driver of the damaged car -- "sorry, social error." But, he doesn't legally have to do anything. Under Committee Print Number One he could just as well back up his car a few feet, and be on his merry way. The fact is that this negligent driver has no responsibility whatsoever to the person whose car he has damaged. Under the Committee Print, the owner of the damaged car, if he has not purchased collision insurance, will have to pay for the total repair of the car himself and, even if

he has purchased insurance, he will have to absorb the \$50 to \$100 no-fault deductible.

It seems odd that at a time when government is pressing the theme of accountability -- and this Committee particularly, having specifically addressed itself to the field of accountability in its warranty legislation, class action legislation, product safety legislation, etc. -- would back away from accountability when it relates to automobile crashes. Yet, we are told by the Department of Transportation that half of our traffic deaths are caused by drinking drivers.

Committee Print Number One would impose a reparation philosophy on our society which runs counter to the expectations of accident victims. In a democratic society, such an imposition can not be a lasting one.

IV. COSTS

In evaluating any important change in a social or economic structure which involves most of us, it is not only highly desirable but well nigh essential that we have a fix on the cost of the new procedure as compared to the program it will replace.

The Alliance Actuarial staff, assisted by the Alliance Actuarial Committee, has attempted to project the bodily injury coverage cost of Committee Print One. Its report is attached (Appendix B).

It must be understood that costing of a proposed program which is radically different than anything now in operation poses many problems, that it involves any number of assumptions, and that the answer is at best only an approximation. Frequency and value of new claims under no-fault system, for instance, can not be determined from claim files developed under the tort liability system. It is widely recognized that injuries arising from single-car accidents are frequently not reported to the insurance company under the present system. Therefore, in considering a program such as the one being proposed, a substantial loading must be included which is at best an estimate.

Particular problems are encountered in costing an insurance program which provides that future wage loss payments

are to be subject to periodic increases. Furthermore, average claims amounts can not be determined where there are vague limitations or no limitations of total benefits payable.

Differences in utilization can not be disregarded. For instance, what we are really talking about when we provide the type of medical benefits suggested in Committee Print One is the broadest possible form of health insurance benefits. Health insurance plans generally rely on a number of control mechanisms to discourage over utilization. Among these, the most widely used are co-insurance, specification of services and inside limits. Yet, these have been waived in Committee Print One.

We know that these factors will play a major role in the cost of Committee Print Number One. Yet, because we have had no experience with programs of this nature, we can not provide for their impact in our costs projection. Hence, even though we evaluate the cost of bodily injury coverages under Committee Print Number One to be greatly in excess of today's bodily injury insurance coverages, we fear that we are grossly underrating the cost potentials of Committee Print Number One.

A. Compulsory Economic Loss Coverage

Using a number of assumptions necessitated by the vagueness of the bill with respect to benefits, and

making conservative estimates of increased frequency, we estimate that the average premium cost of the compulsory bodily injury coverages will be at least 37% greater than current bodily injury liability premiums. In other words, for every \$100 paid today by an automobile policyholder for bodily injury and uninsured motorist coverage (\$10,000 per person and \$20,000 per accident), that same policyholder will pay \$137 for the compulsory economic loss coverage under Committee Print Number One.

B. Optional Intangible Damage Benefit

This optional coverage, described in Section 5(c) (2) (B) of Committee Print One would pay a covered policyholder, on a no-fault, first-party basis, for all intangible damages he and his family may have sustained as a result of injury or death in an automobile accident.

The Department of Transportation's Economic Consequence of Accidents Study revealed that 53% of auto accident victims are not paid by today's tort system. This large group is composed of individuals injured in single-car crashes as well as those whose injuries arise out of their own negligence.

Committee Print Number One would pay all covered injured their full intangible losses. Hence, as related to covered policyholders, one should expect the cost of this coverage to be double that which such policyholders presently pay for intangible loss protection under the present insurance system.

Today, for every \$100 of bodily injury premium cost, \$60 is allocated for intangible loss. Hence, as Exhibit 3 of Appendix B clearly demonstrates, for every \$100 of today's total bodily injury premium cost, this new insurance protection will cost \$120. Put another way, this new limited coverage will cost policyholders 20% more than what they pay today for bodily injury insurance coverage.

C. Property Damage

It has been claimed that eliminating fault as a basis for recovery of damages to automobiles, one can dispense with property damage liability and thus achieve substantial cost savings. This just is not so.

In considering the cost to an individual motorist, one must consider not only the price he pays for purchasing insurance coverage, but also the out-of-pocket costs which he must absorb.

Eliminating fault as a basis for recovery does not eliminate the losses incurred in accidents. Committee Print One would merely require that each car owner bears his own losses, regardless of how his car was damaged.

Today, approximately one-half of all automobile owners do not carry collision insurance coverage. Yet, about one-fourth of all drivers are involved in auto accidents each year. Those not carrying collision insurance today decided against purchasing the coverage partly because they believe that they control the likelihood of their damaging their own cars. However, under the proposed system, these motorists would have very little control over the likelihood of any damage for which they would have to pay to their cars.

Under such circumstances, are many more people likely to feel they have to purchase collision insurance to avoid the potential serious loss over which they have no control? After all, this is the framework on which insurance is founded -- to substitute a small but certain payment for a potentially large and uncertain loss.

Committee Print Number One would pay all covered injured their full intangible losses. Hence, as related to covered policyholders, one should expect the cost of this coverage to be double that which such policyholders presently pay for intangible loss protection under the present insurance system.

Today, for every \$100 of bodily injury premium cost, \$60 is allocated for intangible loss. Hence, as Exhibit 3 of Appendix B clearly demonstrates, for every \$100 of today's total bodily injury premium cost, this new insurance protection will cost \$120. Put another way, this new limited coverage will cost policyholders 20% more than what they pay today for bodily injury insurance coverage.

Eliminating fault as a basis for recovery does not eliminate the losses incurred in accidents. Committee Print One would merely require that each car owner bears his own losses, regardless of how his car was damaged.

Today, approximately one-half of all automobile owners do not carry collision insurance coverage. Yet, about one-fourth of all drivers are involved in auto accidents each year. Those not carrying collision insurance today decided against purchasing the coverage partly because they believe that they control the likelihood of their damaging their own cars. However, under the proposed system, these motorists would have very little control over the likelihood of any damage for which they would have to pay to their cars.

Under such circumstances, we think motorists are likely to feel they have no guarantee of their own chance to avoid the damage to their own cars and that they have no control over the damage to their own cars. This work on which the committee is based is based on a small but certain percentage of a population of motorists and motorists' cars.

Rather than risk a severe loss over which they have no control, about every fourth year, many of those not now buying collision insurance will elect to purchase the coverage.

Those who now feel comfortable doing without collision coverage because of the control they exercise over accidents, are forced by Committee Print Number One to make an agonizing reappraisal and a cold choice: Either elect against purchasing the coverage and leave themselves open to a very substantial loss. An out-of-pocket loss of even a few hundred dollars is painful to most people and devastating to the great majority who are operating on a thin margin of discretionary income -- or to purchase the proposed coverage. This serves to reduce the potential exposure to loss -- although the insured will still have to absorb the deductible when involved in an accident.

Furthermore, we project the cost of collision insurance under Committee Print One to be higher than today's equivalent collision premium. Collision insurance costs today are reduced substantially through subrogation. Committee Print One, by denying the right of subrogation would spread the total automobile

damage cost over collision insurance and self-insurance, whereas today, these costs are spread over collision insurance, self-insurance, and property-damage liability insurance.

Hence, what Committee Print Number One accomplishes by eliminating fault as a basis for recovery to damaged automobiles is forcing automobile owners to either self-insure their own losses or to purchase collision insurance at a substantially higher cost than today's coverage.

D. Conclusion

In conclusion, we project that for every \$100 spent under today's system for bodily injury coverage, a policyholder will spend \$257 for Committee Print One's full bodily injury protection. This breaks down as follows:

| | <u>Present System Cost</u>
<u>(Bodily Injury)</u> | <u>Committee Print One</u>
<u>(Bodily Injury)</u> |
|-----------------|--|--|
| Economic Loss | \$ 40 | \$137 |
| Intangible Loss | <u>\$ 60</u> | <u>\$120</u> |
| Total | \$100 | \$257 |

V. EQUITABLE ALLOCATION OF COST BURDEN

A major impact of Committee Print Number One on our society will be a redistribution of who will bear what losses. Committee Print would require that accident victims pay the greater share of the total incurred automobile accident losses. The present system, on the other hand, bears down hardest on those who have caused the losses, on the theory that as a matter of equity, good drivers should not subsidize those who abuse the privilege of driving.

More specifically, Committee Print Number One would bring about a windfall to two large groups of vehicle users--truck owners and owners of muscle cars. Let us see how each of these groups would fare under the proposal.

Truck owners would have no responsibility whatsoever for injuries arising on the highway except to their own employees riding in their trucks. The fact is that today they already have this responsibility. Full medical benefits and most wage losses are covered and have been covered for many, many years by state workmen's compensation laws. Thus, Committee Print Number One does not impose any new liability or responsibility or cost on the truck owners while removing much of the responsibility and liability and cost which the present auto reparations system imposes on them.

Passenger cars are being asked to subsidize the truckers' use of the road.

This is particularly unfortunate since recent studies and investigations have demonstrated that accidents involving trucks are often due to inadequate maintenance of the trucks or carelessness of drivers arising from long hours on the road and insufficient rest periods. Recent hearings before the Senate Subcommittee on Alcoholism and Narcotics have highlighted the unfortunate working practices in the trucking industry and the Department of Transportation has published reports which clearly show that many trucks on the road today have a great many mechanical defects which cause serious numbers of accidents and deaths.

I want to make it clear that I am not attacking the trucking industry generally--simply pointing out that this industry, like all others, has its irresponsible elements and that Committee Print One would remove one of the strong incentives for encouraging responsible conduct on the part of both owners and drivers.

Committee Print Number One would absolve truck owners from their negligence and would unfairly shift the cost of accidents which they cause on to those who use their cars mainly for pleasure.

collision insurance, at a price higher than the present cost. Even then they would have to pay the first \$50 or \$100 deductible.

The negligent driver himself is a self-employed professional person who earns \$20,000 a year. He also has considerable assets in the form of real estate and stock investments which produce a net income of about \$5,000 a year. What benefit would he receive under the reparation system proposed under Committee Print No. 1? All of his medical expenses would be paid and, since he is not able to pursue his career for the period of 1 year, he would receive \$12,000 in benefits. There is no deduction for the income he receives from other sources.

What equitable principle was used in determining that a man who earns \$20,000 a year should have a substantial portion of his income replaced, while the retired couple receives nothing at all for the damage to their automobile—a serious economic loss to this couple—and nothing at all for their physical impairments which have deprived them of their retirement years? To put the question another way, what are you really replacing when you replace discretionary income beyond the amount required for basic necessities and a decent living? In essence, you are restoring the victim's ability to enjoy a style of life which such discretionary income makes possible. But isn't this also what you are doing when you make payment for general damages under the present liability system for injuries which deprive a person of mobility or in some other manner interfere with his enjoyment of life?

Those who would eliminate payment for general damages have attempted to imply that the inequities which would result are confined to rare instances. But the inequity of eliminating payment for general damages is by no means confined to the rare or bizarre case. More than 55 percent of the persons injured in automobile accidents are nonwage earners—housewives, minor children, retired persons, the unemployed, et cetera. Another substantial proportion of those injured are persons earning only a subsistence level of income or not far above it. If the system fails to provide anything other than net economic loss, is it not discriminating against this large group of auto accident victims? And are they not the group least likely to have purchased any optional benefits which would provide amenities to replace the enjoyment destroyed by the injury? People who have been injured by a negligent driver expect to get paid for their trouble, pain, and inconvenience. Those who have suffered a permanent impairment are even less likely to be satisfied with being paid nothing more than their net economic losses.

III. ACCOUNTABILITY

As I read through the committee print and its report and tried to visualize how the new system would work in practice, I had an uneasy sensation that the world envisioned in this proposal is an unreal world. It is a neat, logical world where the decisions how to treat people are going to be based on economic values alone. It is a world in which people presumably would look upon an injury inflicted by a negligent driver as strictly a random event, devoid of emotion and personal significance beyond the dollars involved. It is a mechanized, dehumanized world which recognizes neither the moral responsibilities of drivers nor the psychological needs of crash victims. Most of all, it

is a world in which human values have been sacrificed to cost efficiency concepts.

Somewhere along the line, the proposal loses sight of the fact that man is not entirely rational, not entirely economic, but is a creature with emotional and psychological needs as well. These needs cannot always be logically articulated. But these are nevertheless real and must be dealt with in designing any future reparation system.

What we have been offered is a system which attempts to meet the accident victim's economic needs but which ignores his sense of justice.

It seems odd that at a time when government is pressing the theme of accountability—and this committee particularly, having specifically addressed itself to the field of accountability in its warranty legislation, class action legislation, product safety legislation, et cetera—would back away from accountability when it relates to automobile crashes.

Committee Print No. 1 would impose a reparation philosophy on our society which runs counter to the expectations of accident victims. In a democratic society, such an imposition cannot be a lasting one.

IV. Costs

In evaluating any important change in a social or economic structure which involves most of us, it is not only highly desirable but well nigh essential that we have a fix on the cost of the new procedure as compared to the program it will replace.

The Alliance Actuarial staff, assisted by the Alliance Actuarial Committee, has attempted to project the bodily injury coverage cost of Committee Print No. 1.

It must be understood that costing of a proposed program which is radically different than anything now in operation poses many problems, that it involves any number of assumptions, and that the answer is at best only an approximation.

A. COMPULSORY ECONOMIC LOSS COVERAGE

Using a number of assumptions necessitated by the vagueness of the bill with respect to benefits, and making conservative estimates of increased frequency, we estimate that the average premium cost of the compulsory bodily injury coverages will be at least 37 percent greater than current bodily injury liability premiums. In other words, for every \$100 paid today by an automobile policyholder for bodily injury and uninsured motorist coverage (\$10,000 per person and \$20,000 per accident), that same policyholder will pay \$137 for the compulsory economic loss coverage under Committee Print No. 1.

B. OPTIONAL INTANGIBLE DAMAGE BENEFIT

The Department of Transportation's Economic Consequence of Accidents Study revealed that 53 percent of auto accident victims are not paid by today's tort system. This large group is composed of individuals injured in single-car crashes as well as those whose injuries arise out of their own negligence.

Committee Print No. 1 would pay all covered injured their full intangible losses. Hence, as related to covered policyholders, one should expect the cost of this coverage to be double that which such policyholders presently pay for intangible loss protection under the present insurance system.

Today, for every \$100 of bodily injury premium cost, \$60 is allocated for intangible loss. Hence, for every \$100 of today's total bodily injury premium cost, this new insurance protection will cost policyholders 20 percent more than what they pay today for bodily injury insurance coverage.

C. PROPERTY DAMAGE

It has been claimed that eliminating fault as a basis for recovery of damages to automobiles, one can dispense with property damage liability and thus achieve substantial cost savings. This just is not so.

In considering the cost to an individual motorist, one must consider not only the price he pays for purchasing insurance coverage, but also the out-of-pocket costs which he must absorb.

Eliminating fault as a basis for recovery does not eliminate the losses incurred in accidents. Committee Print No. 1 would merely require that each car owner bear his own losses, regardless of how his car was damaged.

Those who now feel comfortable doing without collision coverage because of the control they exercise over accidents, are forced by Committee Print No. 1 to make an agonizing reappraisal and a cruel choice: either elect against purchasing the coverage and leave themselves open to a very substantial loss or to purchase the proposed coverage. This serves to reduce the potential exposure to loss—although the insured will still have to absorb the deductible when involved in an accident.

Hence, what Committee Print No. 1 accomplishes by eliminating fault as a basis for recovery to damaged automobiles is forcing automobile owners to either self-insure their own losses or to purchase collision insurance at a substantially higher cost than today's coverage.

D. CONCLUSION

In conclusion, we project that for every \$100 spent under today's system for bodily injury coverage, a policyholder will spend \$257 for Committee Print No. 1's full bodily injury protection.

V. EQUITABLE ALLOCATION OF COST BURDEN

A major impact of Committee Print No. 1 on our society will be a redistribution of who will bear what losses. Committee Print would require that accident *victims* pay the greater share of the total incurred automobile accident losses. The present system, on the other hand, bears down hardest on those who have *caused the losses*, on the theory that as a matter of equity, good drivers should not subsidize those who abuse the privilege of driving.

More specifically, Committee Print No. 1 would bring about a fall to two large groups of vehicle users—truck owners and owners of muscle cars. Let us see how each of these groups will be affected by the proposal.

Truck owners would have no responsibility whatsoever for injuries arising on the highway except to their own employees riding in their trucks. The fact is that today they already have this responsibility. Full medical benefits and most wage losses are covered and have been covered for many many years by workmen's compensation laws. Thus, Committee Print No. 1 does not impose any new liability or responsibility or cost on the truck owners, while removing much of the responsibility and liability and cost which the present auto reparation system imposes on them. Passenger cars are being asked to subsidize the truckers' use of the road.

The owners of high-powered automobiles also would benefit substantially from Committee Print No. 1. As we testified earlier, there is sound statistical evidence indicating that muscle cars cause more accidents and more serious injuries than other private passenger automobiles. The existing compensation mechanism allows this to be reflected in the price which the owners of such cars must pay for insurance. In fact, it is the high cost of insurance which is being blamed by automobile manufacturer executives for the drastic drop in the sale of these cars.

Committee Print No. 1 would force a dramatic change. Most of these cars are owned by young people with little if any family responsibilities. When involved in accidents, these young people have little if any wage losses and, their medical expenses are below average because of the ability of their young bodies to heal quickly. Hence, an insurance system which is predicated on the amount of benefits paid to a victim and not on the losses caused would greatly benefit these people. There would be a two-fold result. On the one hand, the reduced accident and severity rate brought about by the sharp decrease in the number of muscle cars on the road will be reversed. Second, the increased accident costs resulting from the reckless operation of muscle cars would not be paid by the muscle-car owners themselves but, again, by the large body of passenger-car owners. We believe that this shift in cost is not only inequitable but clearly against public interest.

Again, let me stress that Committee Print would restructure the cost burden of automobile accidents by requiring the accident victims to subsidize the reckless driver. It would be difficult, if not impossible, to devise an acceptable merit rating plan under a system based on categorical rejection of the fault concept.

Committee Print No. 1 would restrict the payment of benefits to the extent that the loss exceed, among others, recovery from any "public health insurance plan." Hence, again, although we agree with the need to prevent duplication, we see little justification for switching the cost of automobile accidents from the users of the highway to the general tax base.

Not only is it undesirable, from a standpoint of policy, to hide the cost of automobile accidents within the tax structure—as Committee Print No. 1 would do—but it is also undesirable of first-party automobile insurance would be remembered that an important reason given by insurance supporters in the early days of the automobile was that they bring to bear the rehabilitation expertise that had been done for the workmen's compensation system. I agree with this point and it is for this reason that we are in favor of this

Committee Print No. 1 would pay all covered injured their full intangible losses. Hence, as related to covered policyholders, one should expect the cost of this coverage to be double that which such policyholders presently pay for intangible loss protection under the present insurance system.

Today, for every \$100 of bodily injury premium cost, \$60 is allocated for intangible loss. Hence, for every \$100 of today's total bodily injury premium cost, this new insurance protection will cost policyholders 20 percent more than what they pay today for bodily injury insurance coverage.

C. PROPERTY DAMAGE

It has been claimed that eliminating fault as a basis for recovery of damages to automobiles, one can dispense with property damage liability and thus achieve substantial cost savings. This just is not so.

In considering the cost to an individual motorist, one must consider not only the price he pays for purchasing insurance coverage, but also the out-of-pocket costs which he must absorb.

Eliminating fault as a basis for recovery does not eliminate the losses incurred in accidents. Committee Print No. 1 would merely require that each car owner bear his own losses, regardless of how his car was damaged.

D. CONCLUSION

In conclusion, we project that for every \$100 spent under today's system for bodily injury coverage, a policyholder will spend \$257 for Committee Print No. 1's full bodily injury protection.

V. EQUITABLE ALLOCATION OF COST BURDEN

A major impact of Committee Print No. 1 on our society will be a redistribution of who will bear what losses. Committee Print would require that accident *victims* pay the greater share of the total incurred automobile accident losses. The present system, on the other hand, bears down hardest on those who have *caused the losses*, on the theory that as a matter of equity, good drivers should not subsidize those who abuse the privilege of driving.

More specifically, Committee Print No. 1 would bring about a windfall to two large groups of vehicle users—truck owners and owners of muscle cars. Let us see how each of these groups would fare under the proposal.

Truck owners would have no responsibility whatsoever for injuries arising on the highway except to their own employees riding in their trucks. The fact is that today they already have this responsibility. Full medical benefits and most wage losses are covered and have been covered for many many years by workmen's compensation laws. Thus, Committee Print No. 1 does not impose any new liability or responsibility or cost on the truck owners, while removing much of the responsibility and liability and cost which the present auto reparation system imposes on them. Passenger cars are being asked to subsidize the truckers' use of the road.

The owners of high-powered automobiles also would benefit substantially from Committee Print No. 1. As we testified earlier, there is sound statistical evidence indicating that muscle cars cause more accidents and more serious injuries than other private passenger automobiles. The existing compensation mechanism allows this to be reflected in the price which the owners of such cars must pay for insurance. In fact, it is the high cost of insurance which is being blamed by automobile manufacturer executives for the drastic drop in the sale of these cars.

Committee Print No. 1 would force a dramatic change. Most of these cars are owned by young people with little if any family responsibilities. When involved in accidents, these young people have little if any wage losses and, their medical expenses are below average because of the ability of their young bodies to heal quickly. Hence, an insurance system which is predicated on the amount of benefits *paid* to a victim and not on the *losses caused* would greatly benefit these people. There would be a two-fold result. On the one hand, the reduced accident and severity rate brought about by the sharp decrease in the number of muscle cars on the road will be reversed. Second, the increased accident costs resulting from the reckless operation of muscle cars would not be paid by the muscle-car owners themselves but, again, by the large body of passenger-car owners. We believe that this shift in cost is not only inequitable but clearly against public interest.

Again, let me stress that Committee Print would restructure the cost burden of automobile accidents by requiring the accident victims to subsidize the reckless driver. It would be difficult, if not impossible, to devise an acceptable merit rating plan under a system based on categorical rejection of the fault concept.

Committee Print No. 1 would restrict the payment of benefits to the extent that the loss exceed, among others, recovery from any "public health insurance plan." Hence, again, although we agree with the need to prevent duplication, we see little justification for switching the cost of automobile accidents from the users of the highway to the general tax base.

Not only is it undesirable, from a standpoint of public policy, to hide the cost of automobile accidents within the general tax structure—as Committee Print No. 1 would do—but a major advantage of first-party automobile insurance would be dissipated. It should be remembered that an important reason given by no-fault automobile insurance supporters in the early days of the debate was the need to bring to bear the rehabilitation expertise to auto accident victims as had been done for the workmen's compensation beneficiaries. We agree with this point and it is for this reason that we are recommend-

ing a minimum of \$50,000, first-party automobile coverage in our guaranteed protection plan. We are convinced that the rehabilitation of the traumatically injured can best be undertaken at the direction of those institutions that specialize in managing traumatic medicine. We do not believe that if the care and responsibility for the treatment of automobile accident victims is left in the hands of those who have responsibility for the total medical care of our citizens, that the type of rehabilitative techniques best suited to traumatic case specialties will be applied.

In conclusion, it is obvious that Committee Print No. 1 falls far short of equitably allocating the cost burden of automobile accidents.

VI. COURT CONGESTION

Committee Print No. 1 raises many questions about the extent of coverage to be provided which will need to be answered by the courts, in some instances, on a case by case basis. For instance:

- a. What is the term "accidental harm" intended to cover?
- b. Does the term "operation, maintenance, or use" intend to include injuries received while washing a car, working on it, and so forth? If someone suffers a slipped disc while unloading a bag of fertilizer from the trunk of his car, is this intended to be covered?
- c. If the policyholder backs over his son's bicycle, is it intended that the proposed new policy pay for it?

Our claims people foresee major difficulties and legal controversy in determining what to pay large numbers of auto accident victims for their income loss. The bill proposes to pay actual earning loss as well as expected future earning loss. Many of the 55 percent of the non-wage-earner accident victims expect to enter or reenter the work force at some future date, or to earn supplementary income in some way. How is their claim going to be handled under a system which provides no yardstick for measuring the amount of a loss, and which does not provide for any payment until the loss has already occurred? These problems are present today from the claim viewpoint but they would be greatly exacerbated under a system with no policy limits and no apparent means of reaching a settlement other by obtaining a court order.

The reopening of old cases could be a very troublesome problem. The open-ended nature of unlimited liability imposed on the insurer would require the company to keep open its claims files indefinitely. This also would raise questions about the adequacy of loss reserves.

The system as proposed in Committee Print No. 1 would provide many opportunities and incentives for overutilization of benefits and even outright fraud.

All these uncertainties and complications will develop substantial friction between policyholders and their insurers and will need to be resolved by the courts. Rather than lessening the burden on the courts it is suggested that Committee Print No. 1 will increase it.

In fact, it is apparent that it is contemplated that policyholders will avail themselves frequently of professional, legal expertise. The bill encourages victims to seek legal representation by requiring the insured to pay additional attorney fees in all claims other than those found by the courts to have been frivolous. Thus, even though a claim

may be denied by the courts, unless the court, also found the claim to have been frivolous, an attorney fee would have to be paid by the company.

All in all, Committee Print No. 1 will encourage rather than discourage auto victims, their attorneys, and insurance companies to seek the help of the court to resolve disputes under the system.

VII. CONCLUSION

The following points up some of the basic weaknesses in the structure of Committee Print No. 1:

1. The bill would be expensive and discriminatory for the consumer.
2. It would needlessly and expensively complicate underwriting and claim administration.
3. The bill unfairly shifts the cost burden of automobile accidents from truckers and irresponsible drivers to careful passenger car owners.
4. The bill is inconsistent and ambiguous.
5. The bill eliminates all elements of personal accountability.
6. Like its predecessor, S. 945, the bill would permit Federal preemption of automobile insurance regulations.

Finally, and more precisely, Federal reform of the automobile compensation insurance system just is not needed. There is overwhelming evidence that reform is underway at the State level, and the State legislatures should be given the opportunity to take such action which they believe is in the best interest of their constituencies.

Senator BAKER. I will put to you the same question that I believe we put to each of the previous witnesses.

Would you be agreeable to answering additional questions for the record as they may be submitted?

Mr. MAISONPIERRE. Yes; of course, I will, Senator.

Senator BAKER. With that, I will reserve anything further I may have at this time and use that format.

Thank you for your statement. It is a very meaningful one.

I. INTRODUCTION

My name is Andre Maisonnier and I am Vice President of the American Mutual Insurance Alliance, a national association of mutual property and casualty insurance companies. Our member companies provide automobile and other property-casualty coverages in all fifty states and the District of Columbia.

We welcome this opportunity to discuss Committee Print Number One -- S.945. For the sake of clarity, whenever S.945 is mentioned, it will refer to the original National No-Fault Motor Vehicle Insurance Act and, whenever Print One is mentioned, it will refer to Committee Print Number One, S.945.

It has been suggested that our testimony today be restricted to a technical analysis of Committee Print Number One. We want it clearly understood, however, that the Alliance continues to be unalterably opposed to a national no-fault solution. Our prior testimony before this Committee detailed the reasons for this opposition and nothing has happened in the interval which would make us change our views. In fact, we are more convinced than ever that the states are demonstrating their willingness to come to grips with automobile accident compensation reform. The Alliance is proud of the role it is privileged to play

in assisting state legislatures in structuring reform. We are continuing to press for state enactment of our Guaranteed Protection Plan which was carefully detailed in our prior testimony. Its outlines are again attached to this statement (Appendix A).

If we appear negative today, it is for two reasons: In the first place, we have been asked to limit our comments to Committee Print Number One. Hence, we will refrain from describing to the Committee the positive steps we have taken along the road to reforms in the different states. Secondly, we believe that although Committee Print One substantially differs from S.945, it does not solve the philosophical and practical shortcomings we described in our early testimony before this Committee. On the contrary, Committee Print One has added inequities which, if enacted, would prove to be expensive and discriminatory for consumers. Hence, we look upon Committee Print Number One as a step backwards and certainly not an improvement over S.945.

Any piece of legislation, be it auto reform, tax reform, state or federal, must be measured against well set out objectives. In our complicated world, it is seldom sufficient to meet one or two limited objectives for reform. All must be met in order to structure the balanced approach which ensures fair and equitable treatment of all.

The Alliance believes that any responsible auto insurance reform must achieve a reasonable balance among five different and often contradictory goals:

1. To provide crash victims with prompt and fair compensation.
2. To encourage driver accountability.
3. To keep overall costs at a reasonable level.
4. To equitably allocate the cost burden.
5. To relieve court congestion.

Let us see now how the Committee Print meets these objectives of responsible reform.

II. TO PROVIDE CRASH VICTIMS WITH PROMPT AND FAIR COMPENSATION

For all practical purposes, the bill restricts the benefits to be paid to an automobile accident victim to his medical losses, a portion of his wage losses, and, for those who have purchased collision insurance, a portion of the expenses a policyholder has incurred as a result of his automobile being damaged.

The bill specifically prohibits benefit payments for general damages, permanent disability, amputation, disfigurement, etc., unless the policyholder himself purchases separate insurance protecting him against such losses.

Our prior testimony stressed the reasons why we believe it is imperative to retain some element of general damages within a reparation system. The public opinion surveys which have been made demonstrate without a doubt that innocent automobile accident victims expect to get paid for their permanent impairments in addition to their economic losses.

Print Number One does, in fact, recognize the merits of this point. It provides that policyholders would be offered, on a no-fault basis, reimbursement for such losses. The Committee Staff Analysis advises us that "the controversy over whether the public wants to recover for intangible losses would be resolved by free market forces rather than by legislative determination."

What the Committee Print does not tell us is that because of the way it is structured, the cost of this coverage is likely to be so prohibitive that only those with large, disposable incomes will be able to afford the protection. This doesn't mean, of course, that people who can not afford that protection do not suffer when involved in accidents and do not care to be compensated for permanent, disabling injuries. It just means that they are not able to afford to be compensated for such losses. We believe that this discriminatory approach in the treatment of auto accident victims fails to meet the objective of "fair compensation."

Let's take a closer look at some of the implications that flow from the decision to pay auto accident victims only for their net economic loss.

Envision, if you will, an accident in which a speeding motorist crosses a center line and involves another car in a serious crash. The car that was hit contains a retired couple living on social security and a pension from his former employer. They are also covered by Medicare. They had planned to spend their years of retirement visiting their grandchildren and pursuing such interests as gardening, fishing, and the usual things retired people look forward to. Both suffer crippling injuries which would make it impossible for them to do any of these things.

Under the kind of reparation system envisioned in Print One, this elderly couple would receive no compensation at all from the negligent driver, and would receive little if any compensation from their own compulsory automobile insurance policy. They have no income loss, and their medical expenses are largely covered by Medicare. They would be able to pay the rent and put food on the table from their own resources. But there will be little money available for the amenities which might replace the enjoyment they have been forced to forego. They wouldn't even be able to collect for the damage which the negligent driver had done to their car, unless they had purchased their own collision insurance, at a price higher than the present cost. Even then they would have to pay the first \$50 or \$100 deductible.

The negligent driver himself is a self-employed professional person who earns \$20,000 a year. He has a hospitalization policy, but no income coverage. However, he does have considerable assets in the form of real estate and stock investments which produce a net income of about \$5,000 a year. What benefit would he receive under the reparation system proposed under Committee Print One? All of his medical expenses would be paid and, since he is not able to pursue his career for the period of one year he would

receive \$12,000 in benefits. There is no deduction for the income he receives from other sources.

What equitable principle was used in determining that a man who earns \$20,000 a year should have a substantial portion of his income replaced, while the retired couple receives nothing at all for the damage to their automobile -- a serious economic loss to this couple -- and nothing at all for their physical impairments which have deprived them of the enjoyment of their retirement years? To put the question another way, what are you really replacing when you replace discretionary income beyond the amount required for basic necessities and a decent living? In essence, you are restoring the victim's ability to enjoy a style of life which such discretionary income makes possible. But isn't this also what you are doing when you make payment for general damages under the present liability system for injuries which deprive a person of mobility or in some other manner interfere with his enjoyment of life?

Those who would eliminate payment for general damages have attempted to imply that the inequities which would result are confined to rare instances. It is possible, of course, to find bizarre cases under any system which could be devised. But the inequity of eliminating payment for general damages is by no means confined to the rare or

bizarre case. More than 55% of the persons injured in automobile accidents are non-wage earners -- housewives, minor children, retired persons, the unemployed, etc. Another substantial proportion of those injured are persons earning only a subsistence level of income or not far above it. If the system fails to provide anything other than net economic loss, is it not discriminating against this large group of auto accident victims? And are they not the group least likely to have purchased any optional benefits which would provide amenities to replace the enjoyment destroyed by the injury?

It is argued that general damages should be excluded from compensation because they are subjective in nature and are not susceptible of objective measurements in dollars. As we have already pointed out to the Committee, this is true of a great many things in this world. How much, for instance, is a man's time worth and how is its value determined? Why do we pay a higher wage for overtime, night work and holidays and how is a differential arrived at?

How do we determine the value of a piece of real estate condemned for a highway?

All of these things are subjective in nature. Yet we manage to translate them into dollar amounts by a process of bargaining and compromise. Our society not only is capable

of translating subjective values into dollars -- it insists upon it, and considers it one of the distinguishing features of a democratic society.

Auto accident victims insist upon it also. People who have been injured by a negligent driver expect to get paid for their trouble, pain and inconvenience. Those who have suffered a permanent impairment are even less likely to be satisfied with being paid nothing more than their net economic losses.

III. ACCOUNTABILITY

As I read through the Committee Print and its report and tried to visualize how the new system would work in practice, I had an uneasy sensation that the world envisioned in this proposal is an unreal world. It is a neat, logical world where the decisions how to treat people are going to be based on economic values alone. It is a world in which people presumably would look upon an injury inflicted by a negligent driver as strictly a random event, devoid of emotion and personal significance beyond the dollars involved. It is a mechanized, dehumanized world which recognizes neither the moral responsibilities of drivers nor the psychological needs of crash victims. Most of all, it is a world in which human values have been sacrificed to cost efficiency concepts.

Somewhere along the line, the proposal loses sight of the fact that man is not entirely rational, not entirely economic, but is a creature with emotional and psychological needs as well. These needs can not always be logically articulated. But these are nevertheless real and must be dealt with in designing any future reparation system.

What we have been offered is a system which attempts to meet the accident victim's economic needs but which ignores his sense of justice.

Whatever shortcomings the present auto reparations system has -- and we agree that there are some -- it is based on some fundamental concepts which are not as outmoded as its critics think. One of them is the concept that a driver who negligently inflicts injury and monetary loss should be held accountable for the damage that he has caused. Committee Print Number One totally eliminates this concept.

Let us see how the decision to abolish driver responsibility would operate in practice.

A car is stopped at a red light, at an intersection, waiting for the control signals to turn green before proceeding. Another car careening down the road is unable to negotiate a timely stop and rams into the rear of the stopped automobile, which sustains \$550 damage. The negligent driver, if he has any social grace at all, may tell the driver of the damaged car -- "sorry, social error." But, he doesn't legally have to do anything. Under Committee Print Number One he could just as well back up his car a few feet, and be on his merry way. The fact is that this negligent driver has no responsibility whatsoever to the person whose car he has damaged. Under the Committee Print, the owner of the damaged car, if he has not purchased collision insurance, will have to pay for the total repair of the car himself and, even if

he has purchased insurance, he will have to absorb the \$50 to \$100 no-fault deductible.

It seems odd that at a time when government is pressing the theme of accountability -- and this Committee particularly, having specifically addressed itself to the field of accountability in its warranty legislation, class action legislation, product safety legislation, etc. -- would back away from accountability when it relates to automobile crashes. Yet, we are told by the Department of Transportation that half of our traffic deaths are caused by drinking drivers.

Committee Print Number One would impose a reparation philosophy on our society which runs counter to the expectations of accident victims. In a democratic society, such an imposition can not be a lasting one.

IV. COSTS

In evaluating any important change in a social or economic structure which involves most of us, it is not only highly desirable but well nigh essential that we have a fix on the cost of the new procedure as compared to the program it will replace.

The Alliance Actuarial staff, assisted by the Alliance Actuarial Committee, has attempted to project the bodily injury coverage cost of Committee Print One. Its report is attached (Appendix B).

It must be understood that costing of a proposed program which is radically different than anything now in operation poses many problems, that it involves any number of assumptions, and that the answer is at best only an approximation. Frequency and value of new claims under no-fault system, for instance, can not be determined from claim files developed under the tort liability system. It is widely recognized that injuries arising from single-car accidents are frequently not reported to the insurance company under the present system. Therefore, in considering a program such as the one being proposed, a substantial loading must be included which is at best an estimate.

Particular problems are encountered in costing an insurance program which provides that future wage loss payments

are to be subject to periodic increases. Furthermore, average claims amounts can not be determined where there are vague limitations or no limitations of total benefits payable.

Differences in utilization can not be disregarded. For instance, what we are really talking about when we provide the type of medical benefits suggested in Committee Print One is the broadest possible form of health insurance benefits. Health insurance plans generally rely on a number of control mechanisms to discourage over utilization. Among these, the most widely used are co-insurance, specification of services and inside limits. Yet, these have been waived in Committee Print One.

We know that these factors will play a major role in the cost of Committee Print Number One. Yet, because we have had no experience with programs of this nature, we can not provide for their impact in our costs projection. Hence, even though we evaluate the cost of bodily injury coverages under Committee Print Number One to be greatly in excess of today's bodily injury insurance coverages, we fear that we are grossly underrating the cost potentials of Committee Print Number One.

A. Compulsory Economic Loss Coverage

Using a number of assumptions necessitated by the vagueness of the bill with respect to benefits, and

making conservative estimates of increased frequency, we estimate that the average premium cost of the compulsory bodily injury coverages will be at least 37% greater than current bodily injury liability premiums. In other words, for every \$100 paid today by an automobile policyholder for bodily injury and uninsured motorist coverage (\$10,000 per person and \$20,000 per accident), that same policyholder will pay \$137 for the compulsory economic loss coverage under Committee Print Number One.

B. Optional Intangible Damage Benefit

This optional coverage, described in Section 5(c)(2)(B) of Committee Print One would pay a covered policyholder, on a no-fault, first-party basis, for all intangible damages he and his family may have sustained as a result of injury or death in an automobile accident.

The Department of Transportation's Economic Consequence of Accidents Study revealed that 53% of auto accident victims are not paid by today's tort system. This large group is composed of individuals injured in single-car crashes as well as those whose injuries arise out of their own negligence.

Committee Print Number One would pay all covered injured their full intangible losses. Hence, as related to covered policyholders, one should expect the cost of this coverage to be double that which such policyholders presently pay for intangible loss protection under the present insurance system.

Today, for every \$100 of bodily injury premium cost, \$60 is allocated for intangible loss. Hence, as Exhibit 3 of Appendix B clearly demonstrates, for every \$100 of today's total bodily injury premium cost, this new insurance protection will cost \$120. Put another way, this new limited coverage will cost policyholders 20% more than what they pay today for bodily injury insurance coverage.

C. Property Damage

It has been claimed that eliminating fault as a basis for recovery of damages to automobiles, one can dispense with property damage liability and thus achieve substantial cost savings. This just is not so.

In considering the cost to an individual motorist, one must consider not only the price he pays for purchasing insurance coverage, but also the out-of-pocket costs which he must absorb.

Eliminating fault as a basis for recovery does not eliminate the losses incurred in accidents. Committee Print One would merely require that each car owner bears his own losses, regardless of how his car was damaged.

Today, approximately one-half of all automobile owners do not carry collision insurance coverage. Yet, about one-fourth of all drivers are involved in auto accidents each year. Those not carrying collision insurance today decided against purchasing the coverage partly because they believe that they control the likelihood of their damaging their own cars. However, under the proposed system, these motorists would have very little control over the likelihood of any damage for which they would have to pay to their cars.

Under such circumstances, are many more people likely to feel they have to purchase collision insurance to avoid the potential serious loss over which they have no control? After all, this is the framework on which insurance is founded -- to substitute a small but certain payment for a potentially large and uncertain loss.

Rather than risk a severe loss over which they have no control, about every fourth year, many of those not now buying collision insurance will elect to purchase the coverage.

Those who now feel comfortable doing without collision coverage because of the control they exercise over accidents, are forced by Committee Print Number One to make an agonizing reappraisal and a cold choice: Either elect against purchasing the coverage and leave themselves open to a very substantial loss. An out-of-pocket loss of even a few hundred dollars is painful to most people and devastating to the great majority who are operating on a thin margin of discretionary income -- or to purchase the proposed coverage. This serves to reduce the potential exposure to loss -- although the insured will still have to absorb the deductible when involved in an accident.

Furthermore, we project the cost of collision insurance under Committee Print One to be higher than today's equivalent collision premium. Collision insurance costs today are reduced substantially through subrogation. Committee Print One, by denying the right of subrogation would spread the total automobile

damage cost over collision insurance and self-insurance, whereas today, these costs are spread over collision insurance, self-insurance, and property-damage liability insurance.

Hence, what Committee Print Number One accomplishes by eliminating fault as a basis for recovery to damaged automobiles is forcing automobile owners to either self-insure their own losses or to purchase collision insurance at a substantially higher cost than today's coverage.

D. Conclusion

In conclusion, we project that for every \$100 spent under today's system for bodily injury coverage, a policyholder will spend \$257 for Committee Print One's full bodily injury protection. This breaks down as follows:

| | <u>Present System Cost</u>
<u>(Bodily Injury)</u> | <u>Committee Print One</u>
<u>(Bodily Injury)</u> |
|-----------------|--|--|
| Economic Loss | \$ 40 | \$137 |
| Intangible Loss | <u>\$ 60</u> | <u>\$120</u> |
| Total | \$100 | \$257 |

V. EQUITABLE ALLOCATION OF COST BURDEN

A major impact of Committee Print Number One on our society will be a redistribution of who will bear what losses. Committee Print would require that accident victims pay the greater share of the total incurred automobile accident losses. The present system, on the other hand, bears down hardest on those who have caused the losses, on the theory that as a matter of equity, good drivers should not subsidize those who abuse the privilege of driving.

More specifically, Committee Print Number One would bring about a windfall to two large groups of vehicle users--truck owners and owners of muscle cars. Let us see how each of these groups would fare under the proposal.

Truck owners would have no responsibility whatsoever for injuries arising on the highway except to their own employees riding in their trucks. The fact is that today they already have this responsibility. Full medical benefits and most wage losses are covered and have been covered for many, many years by state workmen's compensation laws. Thus, Committee Print Number One does not impose any new liability or responsibility or cost on the truck owners while removing much of the responsibility and liability and cost which the present auto reparations system imposes on them.

Passenger cars are being asked to subsidize the truckers' use of the road.

This is particularly unfortunate since recent studies and investigations have demonstrated that accidents involving trucks are often due to inadequate maintenance of the trucks or carelessness of drivers arising from long hours on the road and insufficient rest periods. Recent hearings before the Senate Subcommittee on Alcoholism and Narcotics have highlighted the unfortunate working practices in the trucking industry and the Department of Transportation has published reports which clearly show that many trucks on the road today have a great many mechanical defects which cause serious numbers of accidents and deaths.

I want to make it clear that I am not attacking the trucking industry generally--simply pointing out that this industry, like all others, has its irresponsible elements and that Committee Print One would remove one of the strong incentives for encouraging responsible conduct on the part of both owners and drivers.

Committee Print Number One would absolve truck owners from their negligence and would unfairly shift the cost of accidents which they cause on to those who use their cars mainly for pleasure.

The owners of high-powered automobiles also would benefit substantially from Committee Print Number One. As we testified earlier, there is sound statistical evidence indicating that muscle cars cause more accidents and more serious injuries than other private passenger automobiles. The existing compensation mechanism allows this to be reflected in the price which the owners of such cars must pay for insurance. In fact, it is the high cost of insurance which is being blamed by automobile manufacturer executives for the drastic drop in the sale of these cars.

Committee Print Number One would force a dramatic change. Most of these cars are owned by young people with little if any family responsibilities. When involved in accidents, these young people have little if any wage losses and, their medical expenses are below average because of the ability of their young bodies to heal quickly. Hence, an insurance system which is predicated on the amount of benefits paid to a victim and not on the losses caused would greatly benefit these people. There would be a two-fold result. On the one hand, the reduced accident and severity rate brought about by the sharp decrease in the number of muscle cars on the road will be reversed. Secondly, the increased accident costs resulting from the reckless operation of muscle cars would not be paid by the muscle-car owners

themselves but, again, by the large body of passenger-car owners. We believe that this shift in cost is not only inequitable but clearly against public interest.

One of the major considerations involved in assessing the feasibility of any new auto reparations system is how it would work out in practice. How would the proposed new system effect the underwriting and claims handling functions? Which groups of drivers would be regarded as more desirable or less desirable customers, from the standpoint of loss exposure? What new considerations would become pertinent in raising or lowering auto insurance prices for particular groups of individuals?

The Alliance staff asked a group of underwriters to assess Committee Print One. I would like to report on the questions that were raised and the observations that they offered.

1. One of the findings is that the proposed new system would lend itself to many more rating distinctions among drivers than the present classification system in use. This results primarily from the fact that people who apply for insurance would be judged on the basis of the amount of damage they are likely to sustain rather than on the damage they are likely to inflict on someone else. This means that the potential beneficiaries

The owners of high-powered automobiles also would benefit substantially from Committee Print Number One. As we testified earlier, there is sound statistical evidence indicating that muscle cars cause more accidents and more serious injuries than other private passenger automobiles. The existing compensation mechanism allows this to be reflected in the price which the owners of such cars must pay for insurance. In fact, it is the high cost of insurance which is being blamed by automobile manufacturer executives for the drastic drop in the sale of these cars.

Committee Print Number One would force a dramatic change. Most of these cars are owned by young people with little if any family responsibilities. When involved in accidents, these young people have little if any wage losses and, their medical expenses are below average because of the ability of their young bodies to heal quickly. Hence, an insurance system which is predicated on the amount of benefits paid to a victim and not on the losses caused would greatly benefit these people. There would be a two-fold result. On the one hand, the reduced accident and severity rate brought about by the sharp decrease in the number of muscle cars on the road will be reversed. Secondly, the increased accident costs resulting from the reckless operation of muscle cars would not be paid by the muscle-car owners

themselves but, again, by the large body of passenger-car owners. We believe that this shift in cost is not only inequitable but clearly against public interest.

One of the major considerations involved in assessing the feasibility of any new auto reparations system is how it would work out in practice. How would the proposed new system effect the underwriting and claims handling functions? Which groups of drivers would be regarded as more desirable or less desirable customers, from the standpoint of loss exposure? What new considerations would become pertinent in raising or lowering auto insurance prices for particular groups of individuals?

The Alliance staff asked a group of underwriters to assess Committee Print One. I would like to report on the questions that were raised and the observations that they offered.

1. One of the findings is that the proposed new system would lend itself to many more rating distinctions among drivers than the present classification system in use. This results primarily from the fact that people who apply for insurance would be judged on the basis of the amount of damage they are likely to sustain rather than on the damage they are likely to inflict on someone else. This means that the potential beneficiaries

are known to the underwriter and can be examined in more detail with regard to their loss potential. Thus, the present rate classification plans probably would be modified and new plans would evolve as loss experience accumulated. The variables now used in setting rates would continue to be pertinent, plus many new ones such as family income, existence of other insurance, etc. The additions of just the major new variables would produce more than 2.5-million possible rate classifications for New York vehicle owners alone.

2. The system in which the claimants are indentifiable in advance would likewise tend to produce rating categories and/or underwriting decisions based on personal factors which have little or no relevance under the liability system, where the claimants are mostly randomly selected persons who get involved in accidents with the policyholder. In general, our underwriters said higher rates would be required for the following categories of people under Committee Print One:

- a. Persons with large families.
- b. Persons with stationwagons and other vehicles with large capacity.
- c. Persons who use their cars in carpools or take part in other activities likely to fill their cars with wage earners.

- d. Persons who have pre-existing injuries or other health conditions which would make them prone to long and costly medical treatment and disability in case of further injury.
- e. Persons who, because of their marginal skills or age, would be likely to be out of work for protracted periods (perhaps permanently) in the event of even a moderately disabling injury.
- f. Persons living in areas subject to a high accident frequency, because of traffic congestions, poor weather conditions, mediocre law enforcement or other environmental factors. This includes congested older sections of major cities.
- g. Persons likely to incur most expensive medical treatment in the event of a disabling injury--our senior citizens.
- h. Persons exhibiting more "claims consciousness" than the general population.
- i. Motorcycle owners.

On the other hand, lower rates should be charged the following categories of policyholders, other things being equal:

- a. Single persons and those with small families.
- b. Owners of vehicles with limited seating capacity.
- c. Healthy persons.
- d. Persons who have lower wage losses, either because their earnings are low or because their income is from sources which would not be effected by a disabling injury.
- e. Persons who could continue to earn a livelihood despite a disabling injury.

f. Persons who live in areas of low accident frequency and severity.

g. Muscle-car owners.

In some instances, these factors would tend to pull in opposite directions. In other instances, however, the various factors would reinforce each other and create even greater extremes in pricing than is now the case. This assumes that auto insurers would be allowed to establish rate categories that reflect the actual differences in loss potential among various motoring groups and individuals under the proposed type of system. To the extent that the classifications were not permitted to reflect these actual differences, whether for sound public policy reasons, political expediency or for whatever reason, the proposed new system would simply create new groups of unprofitable "substandard risks".

3. Underwriting applications for insurance under the proposed system would become more complex, time consuming and costly. All of the data presently needed would be needed under the new system, including information on geographical location and usage of the vehicle, type of vehicle, the age, sex, and marital status of the owner. In addition, either the agent or a company

representative would have to gather and verify a number of other pieces of information. These include the policyholder's health, number of persons in the family, education and job skills, occupation, existence of other insurance and other sources of reimbursement, the income levels of all members of the family, the taxes they pay, the family's environmental exposure to accidents caused by others. Similar information would be needed in order to determine the benefits payable at the time of loss. This raises a number of troublesome questions:

- a. How would people react to being asked to divulge their income, the taxes they pay, their health problems, personal habits and other similar details?
- b. How would the insurance company verify such personal information without being accused of snooping?
- c. What safeguards would be available to prevent concealment of collateral sources which can be deducted from the benefits paid, tax deductions, second jobs and other information which would have to be taken into account in settling claims?
- d. What penalties would be provided for misstatements and omission of pertinent information on the insurance application?
- e. What would be the degree of cooperation given by employers, doctors, the Internal Revenue Service, hospitals, law enforcement agencies, and other groups when asked to provide and verify the necessary information? How much would they charge for handling the additional paperwork?

Again, let me stress that Committee Print One would restructure the cost burden of automobile accidents by requiring the accident victims to subsidize the reckless driver. It would be difficult, if not impossible, to devise an acceptable merit rating plan under a system based on categorical rejection of the fault concept. Actuarially, a driver's past accident record is a good indicator of his probable future accident frequency. And there is strong public support for the idea of charging higher rates for accident-prone drivers and lower rates for those who are safe drivers.

However, it is also clear that most people are adamantly opposed to being surcharged because of their involvement in an accident which was not their fault. How is fault to be determined under a system which rejects the whole idea of fault? If proponents of Committee Print One remain true to their convictions and ignore fault entirely, will the majority of safe drivers be content to pay surcharges when they are involved in accidents caused by negligent drivers? And if the fault concept is smuggled back into the pricing of insurance, why is it not also a valid concept to use in the settlement of claims?

Committee Print One would restrict the payment of benefits to the extent that the loss exceed, among others,

recovery from any "public health insurance plan." Here again, we see little justification for switching the cost of automobile accidents from the users of the highway to the general tax bases. This also runs counter to Congressional policy adopted in 1967, when Medicaid was amended by requiring that wherever a third party was liable, Medicaid should seek to subrogate the amounts which it paid. In fact, this provision is the only one enacted by Congress since Medicaid came into being, which has brought any relief to the tax bases. What Committee Print One does is reverse this public policy by charging taxpayers with the cost of automobile accidents.

Committee Print One would also make automobile benefits excess to whatever national health insurance plan might be enacted by Congress. Although we concur with the need to prevent duplication between national health benefits and automobile insurance benefits, we believe that the general tax base should not be used to subsidize automobile accidents. National health benefits should only be paid to the extent automobile benefits fail to meet the victims' total medical expenses. Not only is it undesirable, from a standpoint of public policy, to hide the cost of automobile accidents within the general tax structure--as Committee Print One would do--but a major advantage of first-party automobile

insurance would be dissipated. It should be remembered that an important reason given by no-fault automobile insurance supporters in the early days of the debate was the need to bring to bear the rehabilitation expertise to auto accident victims as had been done for the workmen's compensation beneficiaries. We agree with this point and it is for this reason that we are recommending a minimum of \$50,000, first-party automobile coverage in our Guaranteed Protection Plan. We are convinced that the rehabilitation of the traumatically injured can best be undertaken at the direction of those institutions that specialize in managing traumatic medicine. We do not believe that if the care and responsibility for the treatment of automobile accident victim is left in the hands of those that have responsibility for the total medical care of our citizens, that the type of rehabilitative techniques best suited to traumatic case specialities will be applied.

In conclusion, it is obvious that Committee Print One falls far short of equitably allocating the cost burden of automobile accidents.

VI. COURT CONGESTION

There is a great deal of dispute today related to the responsibility of the present system for congesting our courts. We believe that much of the discussion which has related to automobile insurance reparation and "congestion" has been irrelevant. Our courts would be congested even if they did not have to handle a single auto accident case. The objective should be to facilitate the handling of claim disputes so as to minimize the recourse to the courts. Again, this we have done in our Guaranteed Protection Plan.

However, Committee Print One raises a number of questions about the extent of coverage to be provided which will need to be answered by the courts, in some instances on a case-by-case basis. For instance:

A. What is the term "accidental harm" intended to cover? Is the proposed new form of auto insurance intended to pay for all events occurring in automobiles which might be held to constitute "accidental harm," such as kidnapping, rape, robbery, assault, psychic injury attributed to witnessing a gory accident, etc.?

B. The term "operation, maintenance, or use" is said to include "unloading the vehicle" and includes the repair, servicing and maintenance of the car if not done within the course of a business. Is it the inten-

insurance would be dissipated. It should be remembered that an important reason given by no-fault automobile insurance supporters in the early days of the debate was the need to bring to bear the rehabilitation expertise to auto accident victims as had been done for the workmen's compensation beneficiaries. We agree with this point and it is for this reason that we are recommending a minimum of \$50,000, first-party automobile coverage in our Guaranteed Protection Plan. We are convinced that the rehabilitation of the traumatically injured can best be undertaken at the direction of those institutions that specialize in managing traumatic medicine. We do not believe that if the care and responsibility for the treatment of automobile accident victim is left in the hands of those that have responsibility for the total medical care of our citizens, that the type of rehabilitative techniques best suited to traumatic case specialities will be applied.

In conclusion, it is obvious that Committee Print One falls far short of equitably allocating the cost burden of automobile accidents.

VI. COURT CONGESTION

There is a great deal of dispute today related to the responsibility of the present system for congesting our courts. We believe that much of the discussion which has related to automobile insurance reparation and "congestion" has been irrelevant. Our courts would be congested even if they did not have to handle a single auto accident case. The objective should be to facilitate the handling of claim disputes so as to minimize the recourse to the courts. Again, this we have done in our Guaranteed Protection Plan.

However, Committee Print One raises a number of questions about the extent of coverage to be provided which will need to be answered by the courts, in some instances on a case-by-case basis. For instance:

- A. What is the term "accidental harm" intended to cover? Is the proposed new form of auto insurance intended to pay for all events occurring in automobiles which might be held to constitute "accidental harm," such as kidnapping, rape, robbery, assault, psychic injury attributed to witnessing a gory accident, etc.?
- B. The term "operation, maintenance, or use" is said to include "unloading the vehicle" and includes the repair, servicing and maintenance of the car if not done within the course of a business. Is it the inten-

tion to include injuries received while washing a car, working on it, etc.? If someone suffers a slipped disc while unloading a bag of fertilizer from the trunk of his car, is this intended to be covered?

C. Does the bill contemplate that the proposed property damage coverage would pay for damage to the policyholder's own property and that of his family? For example, if the policyholder backs over his son's bicycle, is it intended that the proposed new policy pay for it? If someone loses a valuable gem out of a ring while riding in an automobile, would that be covered under the proposed broad terms of the bill?

No allowance has been made for such claims in cost figures which we have presented today and one can say with certainty how much the "blue sky" coverages and lack of cost controls would increase the cost of the proposed new system. However, such grandiose new social programs have a way of greatly exceeding the cost estimates offered by their proponents in advance of their enactment. The recent sad cost experience with Medicaid and Medicare should be instructive in this regard.

Our claims people foresee major difficulties and legal controversy in determining what to pay large numbers of auto accident victims for their income loss. The bill proposes

to pay actual earning losses as well as expected future earning loss. Several aspects of this issue are troublesome. One is that 55% of the persons injured in auto accidents are not wage earners at the time of the accident. These include minor children, housewives, students, the unemployed and retired persons. Many of these persons expect to enter or reenter the work force at some future date, or to earn supplementary income in some way. How is the claim going to be handled under a system which provides no yardstick for measuring the amount of a loss, and which does not provide for any payment until the loss has already occurred? What assumptions are to be made about the future earning potential of an infant child? A student? A young person just starting out in a business or profession? What assumptions are to be made about the effect of a partial disability on future earning potentials? Is it contemplated that compensation for persons with long-term disabilities or partial disabilities is to be readjusted periodically for inflation? And for the presumed promotions they would have received? Persons whose income is irregular or nonexistent would pose different kinds of problems. What assumptions are to be made about the future "net worth" indicated by a salesman on commission? A self-employed individual? A person whose work is seasonal, as indicated by the title of

performer who was auditioning for a major assignment at the time of the accident? An athlete who had hopes of a professional career? These problems are present today from the claim viewpoint but they would be greatly exacerbated under a system with no policy limits and no apparent means of reaching a settlement other than by obtaining a court order. Because of these problems, it is likely that persons with irregular or speculative income would have more difficulty obtaining insurance under such a system than would a salaried person with a steady job.

The reopening of old cases could be a very troublesome problem. The open-ended nature of unlimited liability imposed on the insurer would require the company to keep open its claims files indefinitely. This also would raise questions about the adequacy of loss reserves.

The system as proposed in Committee Print One would provide many opportunities and incentives for over utilization of benefits and even outright fraud. Please note that:

- A. There is no requirement that an accident occur--not even a recognizable "event" or "occurrence." The bill is completely silent on this.
- B. The term "accidental harm" is extremely broad and undefined.

C. The burden of proof is shifted onto the insurance company, which would be heavily penalized if it failed to pay up within 30 days after the policyholder had made his claim.

All these uncertainties and complications will develop substantial friction between policyholders and their insurers and will need to be resolved by the courts. Rather than lessening the burden on the courts it is suggested that Committee Print One will increase it.

In fact, it is apparent that it is contemplated that policyholders will avail themselves frequently of professional, legal expertise. The bill provides that "a person making a claim under a qualifying no-fault policy may be allowed an award for attorney fees (based upon actual time expended) and too reasonable costs of suit in any case in which the insurer denies all or part of the claim for benefits under such policy unless the court determines that the claim was fraudulent excessive or frivolous." It is clear that whether the insurer acts reasonably or not makes no difference as to the awarding of attorney fees. If, for instance, the first notice of a claim to the insurance company is a letter from an attorney, whether the insurance company had the best intention in the world to pay the claim in full or not would make no difference and unless the filing

of the claim was found to be frivolous, an attorney fee would have to be paid in addition to the economic loss. Only a court would be able to find the filing to be frivolous --hence many cases would gravitate to the courts for a decision on the need for an attorney to become involved on the one hand and the extent of attorney fees on the other.

All in all, Committee Print One will encourage, rather than discourage auto victims, their attorneys and insurance companies to seek the help of the courts to resolve disputes under the system.

VII. CONCLUSION

The following points up some of the basic weaknesses in the structure of Committee Print Number One:

1. The bill would be expensive and discriminatory for the consumer.
2. It would needlessly and expensively complicate underwriting and claim administration.
3. The bill unfairly shifts the cost burden of automobile accidents from truckers and irresponsible drivers to careful passenger-car owners.
4. The bill is inconsistent and ambiguous.
5. The bill eliminates all elements of personal responsibility.

6. Like its predecessor, S. 945, the bill would prevent federal preemption of automobile insurance regulation.

Finally, and more precisely, before, reform of the automobile compensation insurance system can be made. There is overwhelming evidence that reform is necessary at the state level, and the state legislatures should be given the opportunity to take such action which they believe is in the best interest of their citizens.

insurance would be dissipated. It should be remembered that an important reason given by no-fault automobile insurance supporters in the early days of the debate was the need to bring to bear the rehabilitation expertise to auto accident victims as had been done for the workmen's compensation beneficiaries. We agree with this point and it is for this reason that we are recommending a minimum of \$50,000, first-party automobile coverage in our Guaranteed Protection Plan. We are convinced that the rehabilitation of the traumatically injured can best be undertaken at the direction of those institutions that specialize in managing traumatic medicine. We do not believe that if the care and responsibility for the treatment of automobile accident victim is left in the hands of those that have responsibility for the total medical care of our citizens, that the type of rehabilitative techniques best suited to traumatic case specialities will be applied.

In conclusion, it is obvious that Committee Print One falls far short of equitably allocating the cost burden of automobile accidents.

VI. COURT CONGESTION

There is a great deal of dispute today related to the responsibility of the present system for congesting our courts. We believe that much of the discussion which has related to automobile insurance reparation and "congestion" has been irrelevant. Our courts would be congested even if they did not have to handle a single auto accident case. The objective should be to facilitate the handling of claim disputes so as to minimize the recourse to the courts. Again, this we have done in our Guaranteed Protection Plan.

However, Committee Print One raises a number of questions about the extent of coverage to be provided which will need to be answered by the courts, in some instances on a case-by-case basis. For instance:

- A. What is the term "accidental harm" intended to cover? Is the proposed new form of auto insurance intended to pay for all events occurring in automobiles which might be held to constitute "accidental harm," such as kidnapping, rape, robbery, assault, psychic injury attributed to witnessing a gory accident, etc.?
- B. The term "operation, maintenance, or use" is said to include "unloading the vehicle" and includes the repair, servicing and maintenance of the car if not done within the course of a business. Is it the inten-

tion to include injuries received while washing a car, working on it, etc.? If someone suffers a slipped disc while unloading a bag of fertilizer from the trunk of his car, is this intended to be covered?

C. Does the bill contemplate that the proposed property damage coverage would pay for damage to the policyholder's own property and that of his family? For example, if the policyholder backs over his son's bicycle, is it intended that the proposed new policy pay for it? If someone loses a valuable gem out of a ring while riding in an automobile, would that be covered under the proposed broad terms of the bill?

No allowance has been made for such claims in cost figures which we have presented today and one can say with certainty how much the "blue sky" coverages and lack of cost controls would increase the cost of the proposed new system. However, such grandiose new social programs have a way of greatly exceeding the cost estimates offered by their proponents in advance of their enactment. The recent sad cost experience with Medicaid and Medicare should be instructive in this regard.

Our claims people foresee major difficulties and legal controversy in determining what to pay large numbers of auto accident victims for their income loss. The bill proposes

to pay actual earning losses as well as expected future earning loss. Several aspects of this issue are troublesome. One is that 55% of the persons injured in auto accidents are not wage earners at the time of the accident. These include minor children, housewives, students, the unemployed and retired persons. Many of these persons expect to enter or reenter the work force at some future date, or to earn supplementary income in some way. How is the claim going to be handled under a system which provides no yardstick for measuring the amount of a loss, and which does not provide for any payment until the loss has already occurred? What assumptions are to be made about the future earning potential of an infant child? A student? A young person just starting out in a business or profession? What assumptions are to be made about the effect of a person's disability on future earning potential? Is it appropriate to make compensation for persons with disabilities as to be substantially the same as for persons who are disabled for a short period of time? And for the present system the law is very much in a state of confusion. Persons whose income is lost as a result of an accident are treated differently under the law than persons who are disabled for a long period of time. The law is very much in a state of confusion. A person whose only source of income is lost as a result of an accident is treated differently under the law than a person whose only source of income is lost as a result of an accident.

are known to the underwriter and can be examined in more detail with regard to their loss potential. Thus, the present rate classification plans probably would be modified and new plans would evolve as loss experience accumulated. The variables now used in setting rates would continue to be pertinent, plus many new ones such as family income, existence of other insurance, etc. The additions of just the major new variables would produce more than 2.5-million possible rate classifications for New York vehicle owners alone.

2. The system in which the claimants are indentifiable in advance would likewise tend to produce rating categories and/or underwriting decisions based on personal factors which have little or no relevance under the liability system, where the claimants are mostly randomly selected persons who get involved in accidents with the policyholder. In general, our underwriters said higher rates would be required for the following categories of people under Committee Print One:

- a. Persons with large families.
- b. Persons with stationwagons and other vehicles with large capacity.
- c. Persons who use their cars in carpools or take part in other activities likely to fill their cars with wage earners.

- d. Persons who have pre-existing injuries or other health conditions which would make them prone to long and costly medical treatment and disability in case of further injury.
- e. Persons who, because of their marginal skills or age, would be likely to be out of work for protracted periods (perhaps permanently) in the event of even a moderately disabling injury.
- f. Persons living in areas subject to a high accident frequency, because of traffic congestions, poor weather conditions, mediocre law enforcement or other environmental factors. This includes congested older sections of major cities.
- g. Persons likely to incur most expensive medical treatment in the event of a disabling injury--our senior citizens.
- h. Persons exhibiting more "claims consciousness" than the general population.
- i. Motorcycle owners.

On the other hand, lower rates should be charged the following categories of policyholders, other things being equal:

- a. Single persons and those with small families.
- b. Owners of vehicles with limited seating capacity.
- c. Healthy persons.
- d. Persons who have lower wage losses, either because their earnings are low or because their income is from sources which would not be effected by a disabling injury.
- e. Persons who could continue to earn a livelihood despite a disabling injury.

f. Persons who live in areas of low accident frequency and severity.

g. Muscle-car owners.

In some instances, these factors would tend to pull in opposite directions. In other instances, however, the various factors would reinforce each other and create even greater extremes in pricing than is now the case. This assumes that auto insurers would be allowed to establish rate categories that reflect the actual differences in loss potential among various motoring groups and individuals under the proposed type of system. To the extent that the classifications were not permitted to reflect these actual differences, whether for sound public policy reasons, political expediency or for whatever reason, the proposed new system would simply create new groups of unprofitable "substandard risks".

3. Underwriting applications for insurance under the proposed system would become more complex, time consuming and costly. All of the data presently needed would be needed under the new system, including information on geographical location and usage of the vehicle, type of vehicle, the age, sex, and marital status of the owner. In addition, either the agent or a company

representative would have to gather and verify a number of other pieces of information. These include the policyholder's health, number of persons in the family, education and job skills, occupation, existence of other insurance and other sources of reimbursement, the income levels of all members of the family, the taxes they pay, the family's environmental exposure to accidents caused by others. Similar information would be needed in order to determine the benefits payable at the time of loss. This raises a number of troublesome questions:

- a. How would people react to being asked to divulge their income, the taxes they pay, their health problems, personal habits and other similar details?
- b. How would the insurance company verify such personal information without being accused of snooping?
- c. What safeguards would be available to prevent concealment of collateral sources which can be deducted from the benefits paid, tax deductions, second jobs and other information which would have to be taken into account in settling claims?
- d. What penalties would be provided for misstatements and omission of pertinent information on the insurance application?
- e. What would be the degree of cooperation given by employers, doctors, the Internal Revenue Service, hospitals, law enforcement agencies, and other groups when asked to provide and verify the necessary information? How much would they charge for handling the additional paperwork?

f. Persons who live in areas of low accident frequency and severity.

g. Muscle-car owners.

- e. What would be the degree of cooperation given by employers, doctors, the Internal Revenue Service, hospitals, law enforcement agencies, and other groups when asked to provide and verify the necessary information? How much would they charge for handling the additional paperwork?

Again, let me stress that Committee Print One would restructure the cost burden of automobile accidents by requiring the accident victims to subsidize the reckless driver. It would be difficult, if not impossible, to devise an acceptable merit rating plan under a system based on categorical rejection of the fault concept. Actuarially, a driver's past accident record is a good indicator of his probable future accident frequency. And there is strong public support for the idea of charging higher rates for accident-prone drivers and lower rates for those who are safe drivers.

However, it is also clear that most people are adamantly opposed to being surcharged because of their involvement in an accident which was not their fault. How is fault to be determined under a system which rejects the whole idea of fault? If proponents of Committee Print One remain true to their convictions and ignore fault entirely, will the majority of safe drivers be content to pay surcharges when they are involved in accidents caused by negligent drivers? And if the fault concept is smuggled back into the pricing of insurance, why is it not also a valid concept to use in the settlement of claims?

Committee Print One would restrict the payment of benefits to the extent that the loss exceed, among others,

recovery from any "public health insurance plan." Here again, we see little justification for switching the cost of automobile accidents from the users of the highway to the general tax bases. This also runs counter to Congressional policy adopted in 1967, when Medicaid was amended by requiring that wherever a third party was liable, Medicaid should seek to subrogate the amounts which it paid. In fact, this provision is the only one enacted by Congress since Medicaid came into being, which has brought any relief to the tax bases. What Committee Print One does is reverse this public policy by charging taxpayers with the cost of automobile accidents.

Committee Print One would also make automobile benefits excess to whatever national health insurance plan might be enacted by Congress. Although we concur with the need to prevent duplication between national health benefits and automobile insurance benefits, we believe that the general tax base should not be used to subsidize automobile accidents. National health benefits should only be paid to the extent automobile benefits fail to meet the victims' total medical expenses. Not only is it undesirable, from a standpoint of public policy, to hide the cost of automobile accidents within the general tax structure--as Committee Print One would do--but a major advantage of first-party automobile

Is the proposed new form of auto insurance intended to pay for all events occurring in automobiles which might be held to constitute "accidental harm," such as kidnapping, rape, robbery, assault, psychic injury attributed to witnessing a gory accident, etc.?

B. The term "operation, maintenance, or use" is said to include "unloading the vehicle" and includes the repair, servicing and maintenance of the car if not done within the course of a business. Is it the inten-

V. EQUITABLE ALLOCATION OF COST BURDEN

A major impact of Committee Print Number One on our society will be a redistribution of who will bear what losses. Committee Print would require that accident victims pay the greater share of the total incurred automobile accident losses. The present system, on the other hand, bears down hardest on those who have caused the losses, on the theory that as a matter of equity, good drivers should not subsidize those who abuse the privilege of driving.

More specifically, Committee Print Number One would bring about a windfall to two large groups of vehicle users--truck owners and owners of muscle cars. Let us see how each of these groups would fare under the proposal.

Truck owners would have no responsibility whatsoever for injuries arising on the highway except to their own employees riding in their trucks. The fact is that today they already have this responsibility. Full medical benefits and most wage losses are covered and have been covered for many, many years by state workmen's compensation laws. Thus, Committee Print Number One does not impose any new liability or responsibility or cost on the truck owners while removing much of the responsibility and liability and cost which the present auto reparations system imposes on them.

Passenger cars are being asked to subsidize the truckers' use of the road.

This is particularly unfortunate since recent studies and investigations have demonstrated that accidents involving trucks are often due to inadequate maintenance of the trucks or carelessness of drivers arising from long hours on the road and insufficient rest periods. Recent hearings before the Senate Subcommittee on Alcoholism and Narcotics have highlighted the unfortunate working practices in the trucking industry and the Department of Transportation has published reports which clearly show that many trucks on the road today have a great many mechanical defects which cause serious numbers of accidents and deaths.

I want to make it clear that I am not attacking the trucking industry generally--simply pointing out that this industry, like all others, has its irresponsible elements and that Committee Print One would remove one of the strong incentives for encouraging responsible conduct on the part of both owners and drivers.

Committee Print Number One would absolve truck owners from their negligence and would unfairly shift the cost of accidents which they cause on to those who use their cars mainly for pleasure.

The owners of high-powered automobiles also would benefit substantially from Committee Print Number One. As we testified earlier, there is sound statistical evidence indicating that muscle cars cause more accidents and more serious injuries than other private passenger automobiles. The existing compensation mechanism allows this to be reflected in the price which the owners of such cars must pay for insurance. In fact, it is the high cost of insurance which is being blamed by automobile manufacturer executives for the drastic drop in the sale of these cars.

Committee Print Number One would force a dramatic change. Most of these cars are owned by young people with little if any family responsibilities. When involved in accidents, these young people have little if any wage losses and, their medical expenses are below average because of the ability of their young bodies to heal quickly. Hence, an insurance system which is predicated on the amount of benefits paid to a victim and not on the losses caused would greatly benefit these people. There would be a two-fold result. On the one hand, the reduced accident and severity rate brought about by the sharp decrease in the number of muscle cars on the road will be reversed. Secondly, the increased accident costs resulting from the reckless operation of muscle cars would not be paid by the muscle-car owners

themselves but, again, by the large body of passenger-car owners. We believe that this shift in cost is not only inequitable but clearly against public interest.

One of the major considerations involved in assessing the feasibility of any new auto reparations system is how it would work out in practice. How would the proposed new system effect the underwriting and claims handling functions? Which groups of drivers would be regarded as more desirable or less desirable customers, from the standpoint of loss exposure? What new considerations would become pertinent in raising or lowering auto insurance prices for particular groups of individuals?

The Alliance staff asked a group of underwriters to assess Committee Print One. I would like to report on the questions that were raised and the observations that they offered.

1. One of the findings is that the proposed new system would tend to lead to many more policyholders and many drivers than the present system. This results primarily from the fact that policyholders apply for insurance with the proposed new system at the amount of \$100,000, which is the amount of the amount of the policy, and the amount of the policy is the amount of the policy. This would lead to many more policyholders and many drivers than the present system.

are known to the underwriter and can be examined in more detail with regard to their loss potential. Thus, the present rate classification plans probably would be modified and new plans would evolve as loss experience accumulated. The variables now used in setting rates would continue to be pertinent, plus many new ones such as family income, existence of other insurance, etc. The additions of just the major new variables would produce more than 2.5-million possible rate classifications for New York vehicle owners alone.

2. The system in which the claimants are indentifiable in advance would likewise tend to produce rating categories and/or underwriting decisions based on personal factors which have little or no relevance under the liability system, where the claimants are mostly randomly selected persons who get involved in accidents with the policyholder. In general, our underwriters said higher rates would be required for the following categories of people under Committee Print One:

- a. Persons with large families.
- b. Persons with stationwagons and other vehicles with large capacity.
- c. Persons who use their cars in carpools or take part in other activities likely to fill their cars with wage earners.

- d. Persons who have pre-existing injuries or other health conditions which would make them prone to long and costly medical treatment and disability in case of further injury.
- e. Persons who, because of their marginal skills or age, would be likely to be out of work for protracted periods (perhaps permanently) in the event of even a moderately disabling injury.
- f. Persons living in areas subject to a high accident frequency, because of traffic congestions, poor weather conditions, mediocre law enforcement or other environmental factors. This includes congested older sections of major cities.
- g. Persons likely to incur most expensive medical treatment in the event of a disabling injury--our senior citizens.
- h. Persons exhibiting more "claims consciousness" than the general population.
- i. Motorcycle owners.

On the other hand, lower rates should be charged the following categories of policyholders, other things being equal:

- a. Single persons and those with small families
- b. Owners of vehicles with limited seating capacity.
- c. Healthy persons.
- d. Persons who have never before received, or who because they are young and are not yet married their income is from earnings alone, and who are not affected by a family, may, etc.
- e. Persons who are young, who are not married, who are not affected by a family, may, etc.

f. Persons who live in areas of low accident frequency and severity.

g. Muscle-car owners.

In some instances, these factors would tend to pull in opposite directions. In other instances, however, the various factors would reinforce each other and create even greater extremes in pricing than is now the case. This assumes that auto insurers would be allowed to establish rate categories that reflect the actual differences in loss potential among various motoring groups and individuals under the proposed type of system. To the extent that the classifications were not permitted to reflect these actual differences, whether for sound public policy reasons, political expediency or for whatever reason, the proposed new system would simply create new groups of unprofitable "substandard risks".

3. Underwriting applications for insurance under the proposed system would become more complex, time consuming and costly. All of the data presently needed would be needed under the new system, including information on geographical location and usage of the vehicle, type of vehicle, the age, sex, and marital status of the owner. In addition, either the agent or a company

representative would have to gather and verify a number of other pieces of information. These include the policyholder's health, number of persons in the family, education and job skills, occupation, existence of other insurance and other sources of reimbursement, the income levels of all members of the family, the taxes they pay, the family's environmental exposure to accidents caused by others. Similar information would be needed in order to determine the benefits payable at the time of loss. This raises a number of troublesome questions:

- a. How would people react to being asked to divulge their income, the taxes they pay, their health problems, personal habits and other similar details?
- b. How would the insurance company verify such personal information without being accused of snooping?
- c. What safeguards would be available to prevent concealment of collateral sources which can be deducted from the benefits paid, tax deductions, second jobs and other information which would have to be taken into account in settling claims?
- d. What penalties would be provided for misstatements and omission of pertinent information on the insurance application?
- e. What would be the degree of cooperation given by employers, doctors, the Internal Revenue Service, hospitals, law enforcement agencies, and other groups when asked to provide and verify the necessary information? How much would they charge for handling the additional paperwork?

Again, let me stress that Committee Print One would restructure the cost burden of automobile accidents by requiring the accident victims to subsidize the reckless driver. It would be difficult, if not impossible, to devise an acceptable merit rating plan under a system based on categorical rejection of the fault concept. Actuarially, a driver's past accident record is a good indicator of his probable future accident frequency. And there is strong public support for the idea of charging higher rates for accident-prone drivers and lower rates for those who are safe drivers.

However, it is also clear that most people are adamantly opposed to being surcharged because of their involvement in an accident which was not their fault. How is fault to be determined under a system which rejects the whole idea of fault? If proponents of Committee Print One remain true to their convictions and ignore fault entirely, will the majority of safe drivers be content to pay surcharges when they are involved in accidents caused by negligent drivers? And if the fault concept is smuggled back into the pricing of insurance, why is it not also a valid concept to use in the settlement of claims?

Committee Print One would restrict the payment of benefits to the extent that the loss exceed, among others,

recovery from any "public health insurance plan." Here again, we see little justification for switching the cost of automobile accidents from the users of the highway to the general tax bases. This also runs counter to Congressional policy adopted in 1967, when Medicaid was amended by requiring that wherever a third party was liable, Medicaid should seek to subrogate the amounts which it paid. In fact, this provision is the only one enacted by Congress since Medicaid came into being, which has brought any relief to the tax bases. What Committee report number 400 is reverse this public policy by charging taxpayers with the cost of automobile accidents.

[illegible]

insurance would be dissipated. It should be remembered that an important reason given by no-fault automobile insurance supporters in the early days of the debate was the need to bring to bear the rehabilitation expertise to auto accident victims as had been done for the workmen's compensation beneficiaries. We agree with this point and it is for this reason that we are recommending a minimum of \$50,000, first-party automobile coverage in our Guaranteed Protection Plan. We are convinced that the rehabilitation of the traumatically injured can best be undertaken at the direction of those institutions that specialize in managing traumatic medicine. We do not believe that if the care and responsibility for the treatment of automobile accident victim is left in the hands of those that have responsibility for the total medical care of our citizens, that the type of rehabilitative techniques best suited to traumatic case specialities will be applied.

In conclusion, it is obvious that Committee Print One falls far short of equitably allocating the cost burden of automobile accidents.

VI. COURT CONGESTION

There is a great deal of dispute today related to the responsibility of the present system for congesting our courts. We believe that much of the discussion which has related to automobile insurance reparation and "congestion" has been irrelevant. Our courts would be congested even if they did not have to handle a single auto accident case. The objective should be to facilitate the handling of claim disputes so as to minimize the recourse to the courts. Again, this we have done in our Guaranteed Protection Plan.

However, Committee Print One raises a number of questions about the extent of coverage to be provided which will need to be answered by the courts, in some instances on a case-by-case basis. For instance:

A. What is the term "accidental harm" intended to cover? Is the proposed new form of auto insurance intended to pay for all events occurring in automobiles which might be held to constitute "accidental harm," such as kidnapping, rape, robbery, assault, psychic injury attributed to witnessing a gory accident, etc.?

B. The term "operation, maintenance, or use" is said to include "unloading the vehicle" and includes the repair, servicing and maintenance of the car if not done within the course of a business. Is it the inten-

tion to include injuries received while washing a car, working on it, etc.? If someone suffers a slipped disc while unloading a bag of fertilizer from the trunk of his car, is this intended to be covered?

C. Does the bill contemplate that the proposed property damage coverage would pay for damage to the policyholder's own property and that of his family? For example, if the policyholder backs over his son's bicycle, is it intended that the proposed new policy pay for it? If someone loses a valuable gem out of a ring while riding in an automobile, would that be covered under the proposed broad terms of the bill?

No allowance has been made for such claims in cost figures which we have presented today and one can say with certainty how much the "blue sky" coverages and lack of cost controls would increase the cost of the proposed new system. However, such grandiose new social programs have a way of greatly exceeding the cost estimates offered by their proponents in advance of their enactment. The recent sad cost experience with Medicaid and Medicare should be instructive in this regard.

Our claims people foresee major difficulties and legal controversy in determining what to pay large numbers of auto accident victims for their income loss. The bill proposes

to pay actual earning losses as well as expected future earning loss. Several aspects of this issue are troublesome. One is that 55% of the persons injured in auto accidents are not wage earners at the time of the accident. These include minor children, housewives, students, the unemployed and retired persons. Many of these persons expect to enter or reenter the work force at some future date, or to earn supplementary income in some way. How is the claim going to be handled under a system which provides no yardstick for measuring the amount of a loss, and which does not provide for any payment until the loss has already occurred? What assumptions are to be made about the future earning potential of an infant child? A student? A young person just starting out in a business or profession? What assumptions are to be made about the effect of a partial disability on future earning potentials? Is it contemplated that compensation for persons with long-term disabilities or partial disabilities is to be readjusted periodically for inflation? And for the presumed promotions they would have received? Persons whose income is irregular or speculative would pose different kinds of problems. What assumptions are to be made about the future "net economic loss" sustained by a salesman on commission? A self-employed professional person? A person whose work is seasonal or marginal? An actor or

performer who was auditioning for a major assignment at the time of the accident? An athlete who had hopes of a professional career? These problems are present today from the claim viewpoint but they would be greatly exacerbated under a system with no policy limits and no apparent means of reaching a settlement other than by obtaining a court order. Because of these problems, it is likely that persons with irregular or speculative income would have more difficulty obtaining insurance under such a system than would a salaried person with a steady job.

The reopening of old cases could be a very troublesome problem. The open-ended nature of unlimited liability imposed on the insurer would require the company to keep open its claims files indefinitely. This also would raise questions about the adequacy of loss reserves.

The system as proposed in Committee Print One would provide many opportunities and incentives for over utilization of benefits and even outright fraud. Please note that:

- A. There is no requirement that an accident occur--not even a recognizable "event" or "occurrence." The bill is completely silent on this.
- B. The term "accidental harm" is extremely broad and undefined.

C. The burden of proof is shifted onto the insurance company, which would be heavily penalized if it failed to pay up within 30 days after the policyholder had made his claim.

All these uncertainties and complications will develop substantial friction between policyholders and their insurers and will need to be resolved by the courts. Rather than lessening the burden on the courts it is suggested that Committee Print One will increase it.

In fact, it is apparent that it is contemplated that policyholders will avail themselves frequently of professional, legal expertise. The bill provides that "a person making a claim under a qualifying no-fault policy may be allowed an award for attorney fees (based upon actual time expended) and too reasonable costs of suit in any case in which the insurer denies all or part of the claim for benefits under such policy unless the court determines that the claim was fraudulent excessive or frivolous." It is clear that whether the insurer acts reasonably or not makes no difference as to the awarding of attorney fees. If, for instance, the first notice of a claim to the insurance company is a letter from an attorney, that the insurance company had the best intention in the world to pay the claim in full or not would make no difference and make the

of the claim was found to be frivolous, an attorney fee would have to be paid in addition to the economic loss. Only a court would be able to find the filing to be frivolous --hence many cases would gravitate to the courts for a decision on the need for an attorney to become involved on the one hand and the extent of attorney fees on the other.

All in all, Committee Print One will encourage, rather than discourage auto victims, their attorneys and insurance companies to seek the help of the courts to resolve disputes under the system.

VII. CONCLUSION

The following points up some of the basic weaknesses in the structure of Committee Print Number One:

1. The bill would be expensive and discriminatory for the consumer.
2. It would needlessly and expensively complicate underwriting and claim administration.
3. The bill unfairly shifts the cost burden of automobile accidents from truckers and irresponsible drivers to careful passenger-car owners.
4. The bill is inconsistent and ambiguous.
5. The bill eliminates all elements of personal accountability.

6. Like its predecessor, S. 945, the bill would permit federal preemption of automobile insurance legislation.

Finally, and more precisely, federal reform of the automobile compensation insurance system just is not needed. There is overwhelming evidence that reform is necessary at the state level, and the S. 945 bill provides nothing but the opportunity to take such action which every nation is in the best interest of their own population.

Appendix AInsurance Provisions of the Guaranteed Protection Plan
American Mutual Insurance Alliance

The Guaranteed Protection Plan is a proposal for responsibility in automobile insurance, vehicle design, driver performance and traffic safety regulations. Provisions of the proposed insurance reforms are as follows:

1. Auto crash victims would be guaranteed prompt payment of their basic medical and income losses. State laws would be amended to require that every private passenger automobile policy shall include as minimum benefits, payable regardless of fault:

- a. Medical and hospital expense coverage up to \$50,000 a person, with an optional deductible of up to \$1,000.
- b. Disability income coverage of 85% of gross income lost, subject to a maximum of \$500 per month or a total of \$6,000.

Coverage extends to the policyholder, resident members of his household, passengers in his vehicle and pedestrians injured by his vehicle.

Insurance companies, of course, would be permitted to offer broader coverages than the statutory minimums.

2. Existing liability protection would be retained. The injured person retains the right to seek a tort recovery against a negligent motorist. Payments already received on a first-party basis would be deducted from

any liability settlement or court award. Insurers paying first-party benefits to innocent victims would be entitled to subrogate against the negligent motorist for reimbursement. Intercompany subrogation claims would be handled by arbitration. Thus the principle of driver responsibility would be retained and the financial consequences of the accident ultimately would be charged against the insurance record of the negligent motorist and not against the record of his unfortunate victim as would be the case under a total no-fault system.

3. Several cost-reducing features are included. The major one is a provision to curb nuisance claims and to provide an objective yardstick for measuring general damages. Payment for these damages would be limited to those cases where medical and hospital expenses exceed \$1,000. These limits do not apply in cases involving death, permanent disfigurement, dismemberment, permanent loss of a bodily function, or in other serious cases where a court or jury finds that such a limitation would be unjust.

Another cost reducer in third-party liability claims is a provision for deducting 15% from the gross income loss in recognition of the presumed income tax savings.

Appendix A - p.2

The proposal also would permit insurers to sell policies that are excess of certain collateral sources of reimbursement with respect to the first-party medical and income benefits, as some policies now do with respect to medical payments insurance. In the case of the mandatory first-party benefits an insurer may offset collateral benefits payable to the named insured and members of his household under workmen's compensation or uninsured motorist coverages, and may offset part or all of other collateral benefits in paying the mandatory first-party benefits to guest passengers and pedestrians. No offset of collateral benefits is proposed for third-party tort recoveries, except that benefits which the injured person already has received under the mandatory first-party auto insurance benefits will be deducted.

4. Two different types of arbitration would be used to speed settlements, cut the cost of handling claims and ease the burden on the courts. The Plan calls for mandatory arbitration of the vast numbers of liability claims involving damages under \$3,000, using court-supervised procedures which have worked successfully in Pennsylvania since 1952. As noted above, intercompany

arbitration also would be used to resolve disputes arising in subrogation claims.

5. Fraudulent claims would be discouraged. The Plan calls for imposing stiff penalties for false and fraudulent activities with respect to claims filed against individuals or insurance companies, or for improperly withholding information needed to settle claims.

6. It has been charged that lawyers' fees in auto accident cases are too high. The Guaranteed Protection Plan would deal with this criticism in two ways -- by resolving most claim disputes out of court, and by the passage of legislation calling for the courts to regulate contingency fees charged by attorneys for handling personal injury lawsuits.

7. The Plan also calls for legislation that would encourage use of advance payments procedures, by providing that such payments do not constitute an admission of liability in any subsequent judicial proceedings. This would give further impetus to the widespread practice of advancing funds to injured victims as medical and wage losses accrue in liability cases, and would promote prompt settlement of property damage liability claims without waiting for settlement of bodily injury claims arising from the same accident.

8. Unwarranted cancellations would be prohibited by legislation restricting cancellation of auto insurance policies to cases of non-payment of premium or suspension of the insured's driver's license or revocation of his vehicle registration.
9. The Plan calls for adoption of comparative negligence laws patterned after the one used successfully for many years in Wisconsin.
10. Property damage claims would continue to be handled as now. Car owners whose vehicles are damaged by a negligent motorist may file a liability claim for reimbursement. Car owners also may purchase first-party collision and comprehensive coverages to pay for damage to their own cars.

Appendix B

Cost Analysis
Compulsory Economic Loss Coverage
Committee Print One

Introduction and Summary

This is a preliminary cost analysis of Committee Print One of S.945 prepared by the staff of the American Mutual Insurance Alliance. It follows the same procedure used by the Alliance Actuarial Committee's review and critique of the cost estimates offered in support of the American Insurance Association's "Complete Personal Protection Automobile Insurance Plan."¹

The preliminary costs estimates of Committee Print One were prepared by the Alliance staff with guidance and review by the Alliance Actuarial Committee. Data underlying the estimates were obtained from appendix to the cost study of the AIA Report and from reports issued by the Department of Transportation in connection with the study of automobile liability insurance made by Department of Transportation.²

-
1. American Insurance Association, Report of Special Committee to Study and Evaluate the Keeton-O'Connell Basic Protection Plan and Automobile Accident Reparations, 1968.
 2. Department of Transportation Automobile Insurance and Compensation Study, Economic Consequences of Automobile Accident Injuries, Volume I, April 1970.
Department of Transportation, Automobile Insurance and Compensation Study, Automobile Personal Injury Claims, Volume II, July 1970.

Information obtained from the New York Insurance Department "Actuarial Supplement to Automobile Insurance...For Whose Benefit?"³ was also used in making the cost estimates.

It should be pointed out that any estimate of the cost of a new automobile system involving a replacement of the tort system by first-party coverage is subject to a large possible error. The problem is one of determining frequency of claims and average amounts of claims under the new system. Data developed under the tort system, for example from liability claim files, are of little help in determining the frequency of claims under a no-fault plan. Average amount of claims cannot be determined where there is a material change in benefits to be provided. This is particularly true in costing Committee Print One of S.945 which provides that future wage loss payments are to be subject to periodic increases "in a manner corresponding to annual compensation increases that would periodically result but for the injury of death."⁴ Committee Print One also provides that in determining loss of earnings of an unemployed person (housewife,

4. S.945 page 5, lines 16-19

students, unemployed worker, retirees, children) consideration must be given to the "anticipated annual compensation after income taxes of such person paid from the time such person would reasonably have been expected to be regularly employed."⁵ Average claims amounts can not be determined where there are vague limitations or no limitations of total benefits payable. For example, the bill provides:

A. All appropriate and reasonable expenses necessarily incurred for medical, hospital, surgical, professional nursing, dental, ambulance, prosthetic services, and any Federally recognized religious remedial care and treatment;

B. All appropriate and reasonable expenses necessarily incurred for psychiatric, physical, and occupational therapy and rehabilitation.⁶

The analysis of Committee Print One made by Senate

Commerce Committee staff states:

"Committee Print Number One, in effect, makes available to all the motoring public all the benefits that the present automobile reparations system now provides to the accident victim who is not found negligent or contributorily negligent and who is injured by someone who is found negligent and is fully insured up to the extent of the loss suffered by the accident victim."

5. S.945 page 5, lines 10-15

6. S.945 page 3, line 24 and page 4, lines 1-7

performer who was auditioning for a major assignment at the time of the accident? An athlete who had hopes of a professional career? These problems are present today from the claim viewpoint but they would be greatly exacerbated under a system with no policy limits and no apparent means of reaching a settlement other than by obtaining a court order. Because of these problems, it is likely that persons with irregular or speculative income would have more difficulty obtaining insurance under such a system than would a salaried person with a steady job.

The reopening of old cases could be a very troublesome problem. The open-ended nature of unlimited liability imposed on the insurer would require the company to keep open its claims files indefinitely. This also would raise questions about the adequacy of loss reserves.

The system as proposed in Committee Print One would provide many opportunities and incentives for over utilization of benefits and even outright fraud. Please note that:

- A. There is no requirement that an accident occur--not even a recognizable "event" or "occurrence." The bill is completely silent on this.
- B. The term "accidental harm" is extremely broad and undefined.

C. The burden of proof is shifted onto the insurance company, which would be heavily penalized if it failed to pay up within 30 days after the policyholder had made his claim.

All these uncertainties and complications will develop substantial friction between policyholders and their insurers and will need to be resolved by the courts. Rather than lessening the burden on the courts it is suggested that Committee Print One will increase it.

In fact, it is apparent that it is contemplated that policyholders will avail themselves frequently of professional, legal expertise. The bill provides that "a person making a claim under a qualifying no-fault policy may be allowed an award for attorney fees (based upon actual time expended) and too reasonable costs of suit in any case in which the insurer denies all or part of the claim for benefits under such policy unless the court determines that the claim was fraudulent, excessive or frivolous." It is clear that whether the insurer will indemnify or not makes no difference as to the amount of recovery. In, for instance, the first report of a claim to the insurance company is a letter from the company, stating that the insurance company had the best interest in the world in paying the claim in full or not would make no difference and in any case, it

of the claim was found to be frivolous, an attorney fee would have to be paid in addition to the economic loss. Only a court would be able to find the filing to be frivolous --hence many cases would gravitate to the courts for a decision on the need for an attorney to become involved on the one hand and the extent of attorney fees on the other.

All in all, Committee Print One will encourage, rather than discourage auto victims, their attorneys and insurance companies to seek the help of the courts to resolve disputes under the system.

VII. CONCLUSION

The following points up some of the basic weaknesses in the structure of Committee Print Number One:

1. The bill would be expensive and discriminatory for the consumer.
2. It would needlessly and expensively complicate underwriting and claim administration.
3. The bill unfairly shifts the cost burden of automobile accidents from truckers and irresponsible drivers to careful passenger-car owners.
4. The bill is inconsistent and ambiguous.
5. The bill eliminates all elements of personal accountability.
6. Like its predecessor, S.945, the bill would permit federal preemption of automobile insurance regulations.

Finally, and more precisely, federal reform of the automobile compensation insurance system just is not needed. There is overwhelming evidence that reform is underway at the state level, and the state legislatures should be given the opportunity to take such action which they believe is in the best interest of their constituencies.

Appendix AInsurance Provisions of the Guaranteed Protection Plan
American Mutual Insurance Alliance

The Guaranteed Protection Plan is a proposal for responsibility in automobile insurance, vehicle design, driver performance and traffic safety regulations. Provisions of the proposed insurance reforms are as follows:

1. Auto crash victims would be guaranteed prompt payment of their basic medical and income losses. State laws would be amended to require that every private passenger automobile policy shall include as minimum benefits, payable regardless of fault:

- a. Medical and hospital expense coverage up to \$50,000 a person, with an optional deductible of up to \$1,000.

6. It has been charged that lawyers' fees in auto accident cases are too high. The Guaranteed Protection Plan would deal with this criticism in two ways -- by resolving most claim disputes out of court, and by the passage of legislation calling for the courts to regulate contingency fees charged by attorneys for handling personal injury lawsuits.

7. The Plan also calls for legislation that would encourage use of advance payments procedures, by providing that such payments do not constitute an admission of liability in any subsequent judicial proceeding. This would give further impetus to the widespread practice of advancing funds to injured victims on medical and wage losses accrue to liability claims, and which promote prompt settlement of personal injury claims without waiting for decisions by courts or juries, claims arising from the same accident.

Approved by the Board

8. Unwarranted cancellations would be prohibited by legislation restricting cancellation of auto insurance policies to cases of non-payment of premium or suspension of the insured's driver's license or revocation of his vehicle registration.

9. The Plan calls for adoption of comparative negligence laws patterned after the one used successfully for many years in Wisconsin.

10. Property damage claims would continue to be handled as now. Car owners whose vehicles are damaged by a negligent motorist may file a liability claim for reimbursement. Car owners also may purchase first-party collision and comprehensive coverages to pay for damage to their own cars.

Appendix B

Cost Analysis
Compulsory Economic Loss Coverage
Committee Print One

Introduction and Summary

This is a preliminary cost analysis of Committee Print One of S.945 prepared by the staff of the American Mutual Insurance Alliance. It follows the same procedure used by the Alliance Actuarial Committee's review and critique of the cost estimates offered in support of the American Insurance Association's "Complete Personal Protection Automobile Insurance Plan."¹

The preliminary costs estimates of Committee Print One were prepared by the Alliance staff with guidance and review by the Alliance Actuarial Committee. Data underlying the estimates were obtained from appendix to the cost study of the AIA Report and from reports issued by the Department of Transportation in connection with the study of automobile liability insurance made by Department of Transportation.²

-
1. American Insurance Association, Report of Special Committee to Study and Evaluate the Keeton-O'Connell Basic Protection Plan and Automobile Accident Reparations, 1968.
 2. Department of Transportation Automobile Insurance and Compensation Study, Economic Consequences of Automobile Accident Injuries, Volume 1, April 1970.
 Department of Transportation, Automobile Insurance and Compensation Study, Automobile Personal Injury Claims, Volume II, July 1970.

Information obtained from the New York Insurance Department "Actuarial Supplement to Automobile Insurance...For Whose Benefit?"³ was also used in making the cost estimates.

It should be pointed out that any estimate of the cost of a new automobile system involving a replacement of the tort system by first-party coverage is subject to a large possible error. The problem is one of determining frequency of claims and average amounts of claims under the new system. Data developed under the tort system, for example from liability claim files, are of little help in determining the frequency of claims under a no-fault plan. Average amount of claims cannot be determined where there is a material change in benefits to be provided. This is particularly true in costing Committee Print One of S.945 which provides that future wage loss payments are to be subject to periodic increases "in a manner corresponding to annual compensation increases that would periodically result but for the injury of death."⁴ Committee Print One also provides that in determining loss of earnings of an unemployed person (housewife,

"Committee Print Number One, in effect, makes available to all the motoring public all the benefits that the present automobile reparations system now provides to the accident victim who is not found negligent or contributorily negligent and who is injured by someone who is found negligent and is fully insured up to the extent of the loss suffered by the accident victim."

5. S.945 page 5, lines 10-15

6. S.945 page 3, line 24 and

Information obtained from the New York Insurance Department "Actuarial Supplement to Automobile Insurance...For Whose Benefit?"³ was also used in making the cost estimates.

It should be pointed out that any estimate of the cost of a new automobile system involving a replacement of the tort system by first-party coverage is subject to a large possible error. The problem is one of determining frequency of claims and average amounts of claims under the new system. Data developed under the tort system, for example from liability claim files, are of little help in determining the frequency of claims under a no-fault plan. Average amount of claims cannot be determined where there is a material change in benefits to be provided. This is particularly true in costing Committee Print One of S.945 which provides that future wage loss payments are to be subject to periodic increases "in a manner corresponding to annual compensation increases that would periodically result but for the injury of death."⁴ Committee Print One also provides that in determining loss of earnings of an unemployed person (housewife,

3. State of New York Insurance Department, Actuarial Supplement to "Automobile Insurance...For Whose Benefits"? Development of Estimated Cost and Premium Comparisons of Present and Proposed Automobile Insurance Systems, 1970.

4. S.945 page 5, lines 16-19

students, unemployed worker, retirees, children) consideration must be given to the "anticipated annual compensation after income taxes of such person paid from the time such person would reasonably have been expected to be regularly employed."⁵ Average claims amounts can not be determined where there are vague limitations or no limitations of total benefits payable. For example, the bill provides:

A. All appropriate and reasonable expenses necessarily incurred for medical, hospital, surgical, professional nursing, dental, ambulance, prosthetic services, and any Federally recognized religious remedial care and treatment;

B. All appropriate and reasonable expenses necessarily incurred for psychiatric, physical, and occupational therapy and rehabilitation.⁶

The analysis of Committee Print One made by Senate

Commerce Committee staff states:

"Committee Print Number One, in effect, makes available to all the motoring public all the benefits that the present automobile reparations system now provides to the accident victim who is not found negligent or contributorily negligent and who is injured by someone who is found negligent and is fully insured up to the extent of the loss suffered by the accident victim."

5. S.945 page 5, lines 10-15

6. S.945 page 3, line 24 and page 4, lines 1-7

It is clear therefore that it is expected that there would be many more claims under the system to be established than under the present automobile reparations system. However, no estimate is made by the committee staff of the increase in frequency of claims nor of the expected average claim payment nor of the cost of the new system. It is difficult to see with an increase in number of claims and with "all the benefits that the present automobile reparations system now provides," how the new system would cost less. It is obvious that the new system will cost more - the actuarial problem is how much more.

Using a number of assumptions necessitated by the vagueness of the bill with respect to benefits, and making conservative estimates of increased frequency, the staff of the American Mutual Insurance Alliance estimates that the average premium cost of the compulsory coverages will be at least 37% greater than current Bodily Injury Liability premiums.

Benefits to be paid under a "Qualifying No-Fault Policy"

The benefits to be paid under a qualifying no-fault policy are stated in Sec. 5 (a) and (b) of Committee Print One. These benefits are summarized as follows and costs estimates in terms of current bodily injury costs are

presented for each summary group. All estimated costs are expressed in terms of percentage of current B.I. and U.M. loss costs for standard limits of \$10,000 per person and \$20,000 per accident (loss costs include medical expenses, wage losses and general damages paid under the tort system).

A. Medical Expenses - 49% of current bodily injury costs

"All appropriate and reasonable expenses necessarily incurred for medical, hospital, surgical, professional nursing, dental, ambulance, prosthetic services, and and Federally recognized religious remedial care and treatment."⁷

B. Rehabilitation - 3% of current bodily injury costs

"All appropriate and reasonable expenses necessarily incurred for psychiatric, physical, and occupational therapy and rehabilitation."⁸

C. Income Loss - 83% of current bodily injury costs

1. "The monthly earnings for the period during which the injury or death results in the inability to engage in available and appropriate gainful activity" limited by \$1,000 per month.

2. "A monthly amount equal to the amount (if any) by which (i) a person's monthly earnings or \$1,000, whichever is less exceeds (ii) any lesser monthly earning of such person at such times as he resumes gainful activity.

7. S.945 - page 3, line 24, page 4, lines 1-4

8. S.945 page 4, lines 5-7

3. Survivors benefits - "net economic loss sustained by spouse and dependents as a result of... death."

All of the above benefits to be "periodically increased in a manner corresponding to annual compensations increases that would predictably result but for the injury."

D. General Damages - 5% of current bodily injury costs

Compensation for damage other than economic loss to guests and pedestrians who are members of non-car-owning families on a no-fault basis.⁹

E. Miscellaneous expenses - 12% of current bodily injury costs

"All appropriate and reasonable expenses necessary incurred as a result of injury or death"¹⁰ including, but not limited to:

1. Expenses incurred in obtaining services in substitution of those that the injured or deceased person would have performed for the benefit of himself or his family,
2. Funeral expenses, and
3. Attorneys' fees and costs to the extent provided in Section 8.

9. S.945, page 12, lines 7-12

10. S.945, page 4, lines 19-24, page 5, lines 1 and 2

Medical Expenses

Medical expenses under a no-fault automobile reparation plan were estimated by the American Insurance Association, the New York Insurance Department and by the Actuarial Committee of the American Insurance Alliance. Using as a base for costing and for comparison with the current automobile system. bodily injury liability costs and uninsured motorists loss costs are taken as unity. Estimated costs are then expressed in terms of percentage of B.I. and U.M. Loss Costs.

Based on the AIA sample of claim files, the AIA estimated that medical expenses would be 37.9%¹¹. The New York Department estimated that medical expenses would be 37.7% using a subsample (N.Y. data only) of the AIA sample. The Alliance Actuarial Committee after careful study of the AIA data and data from other sources was of the opinion that the AIA and the New York Department had underestimated the number of injuries that would become claims under a no-fault plan. The reasons for this opinion are presented in the Alliance's Actuarial Report on the Adequacy of the Costing of the American Insurance Association's "Complete Personal Protection Automobile Insurance Plan." Since this report

11. AIA study, Exhibit II, sheet 1

was published, the data made available in the Department of Transportation study of serious auto injury cases¹² reveals that the Alliance projections are very conservative. Whereas the AIA had estimated that the number of persons collecting bodily injury benefits would increase 27% under a total no-fault system, and the Alliance projected a 65% increase, the Department of Transportation data indicates that only 47.7% of today's seriously injured crash victims receive compensation under the tort system. If this Department of Transportation finding was taken at face value, then the number of compensable injuries could be expected to more than double under a no-fault system. Nevertheless, we have stayed with the more conservative projection of a 65% increase.

Since the AIA had used an estimated percentage increase of only 27%, the Alliance compensable injury frequency adjustment factor was 1.30 (1.65 divided by 1.27). Applying this factor to the AIA medical cost estimate, the AMIA estimates that these costs would be 49.3%. It should be pointed out, however, that the AIA and the New York Department also had underestimated the average medical loss costs as well as the frequency because the AIA sample

12. Department of Transportation: Economic Consequences of Automobile Accident Injuries, Volume 1, page 47

contains no cases with medical expenses greater than \$20,000. Since S.945 provides for unlimited medical the estimate of 49% of B.I. and U.M. costs for medical expenses is conservative.

Rehabilitation

Under the tort system a minor part of the total B.I. costs goes toward rehabilitation. It is impossible from a study of claim files developed under a tort system to determine the cost of "psychiatric, physical and occupational therapy and rehabilitation" which would be provided for without limitations by Committee Print One. Complicating the cost analysis is the problem of the estimation of the rehabilitation costs which would be borne by public health facilities. Also to some extent a rehabilitation program would reduce "income loss" which would be greater if there was no rehabilitation. The New York Department is considering this question in the "Actuarial Supplement to Automobile Insurance...For Whose Benefit?"¹³ stated:

"It is believed that the possible additional costs of such rehabilitative procedures would be more than overcome by the resulting reduction in long-term income loss and medical expense."

13. New York Department Study, page 31

However, the Alliance Actuarial Committee felt that Committee Print One with its emphasis on psychiatric and occupational therapy would involve extra costs not offset either by public health programs nor by reduction in medical expenses and wage loss. The Alliance staff estimates the rehabilitation costs as 3% of B.I. and U.M. costs.

Income Loss

Under a no-fault automobile plan the AIA estimated "income loss" with a \$750 per month limitation and a 15% tax deductible costs to be 21.2%. The New York Department estimates, which include not only "income loss" but "additional cost of long-term cases," "deferred benefit to disabled children" and survivorship benefit as "death cases liability to 10/20 limits" amounts to 42.6%. It is the opinion of the Alliance Actuarial Committee that the "income loss" estimates of the AIA and the New York Department are understated because of the underestimation of the frequency of cases under a no-fault program and an underestimation of the average claim cost. This is particularly true of the AIA estimates which did not include income loss due to permanent partial injuries, income loss beyond 99 weeks of disability due to permanent total injuries, and survivor's benefits in death cases. The AMIA staff estimate

of the total income loss including survivorship benefits is 83%. The calculations are shown in attached Exhibit 1. As indicated in notes 2 and 3 of this exhibit, the Department of Transportation's Economic Consequences study would indicate that the income loss is even greater than is projected in the Alliance's analysis.

General Damages to Pedestrians and Guests

Section 5 (b) (1) of the bill provides that the insurer shall pay, without regard to fault, compensation for damages other than economic loss, to pedestrians and guests (not an owner of a motor vehicle or a spouse or dependent of an owner). The cost of this provision as shown in Exhibit 2 is 5% of B.I. plus U.M. costs.

Miscellaneous Expenses

Miscellaneous expenses, not including payment of claimant's attorney's fees provided for by Section 8 (a) of Committee Print One was estimated by AIA to be 6.9% of B.I. and U.M. loss costs. Multiplying this present by 1.30 to adjust for expected injury frequency, an estimate of 9% is obtained to cover such costs. Section 8 (a) provides that "a person making a claim under a qualifying no-fault policy may be allowed an award of a reasonable sum for attorney's fee (based upon actual time expended) and all reasonable

costs of suit in any case in which the insurer denies all or part of a claim for benefits under such policy unless the court determines that the claim was fraudulent, excessive, or frivolous." No data is available to cost this provision. The costs will depend on the number of claims which are resisted, the amount of time attorneys would spend on such cases, the attorney's rate per hour, and court decisions on whether claims are excessive--all under an untried new reparations system. The costs also would include the cases for which claims for general damages are made by pedestrians and guests. Under the tort system the Department of Transportation estimates that attorney's fees amounted to 27.3% of total payments to all claimants.¹⁴ Assuming that only 10% of total attorneys' fees would be covered under Section 8 (a) of Committee Print One the cost would be 3%. Adding this rough estimate of attorney fees to other miscellaneous expenses produces a total for this item of 12%.

Collateral Sources

The economic loss benefits of the qualifying no-fault policy would be primary except that these benefits would

14. U. S. Department of Transportation, Automobile Personal Injury Claims, (1970) Volume 1, page 80.

be excess of any public health insurance plan or any private insurance policy that provides a primary clause. The AIA survey¹⁵ indicates that medicare and workmen's compensation would amount to 6.5% of medical expenses. Applying this 6.5% to the 49% of estimated medical expense, the collateral sources offset would be approximately 3%. It is unknown to what extent private insurance plans would be made primary over automobile no-fault plans. If they are made primary the result would be a shifting of costs from the auto no-fault plan of Committee Print One to other insurance plans. For this analysis of costs under Committee Print One, no assumptions are made as to additional offsets other than medicare and workmen's compensation.

Estimated Total Cost of Benefits

The following is a summary of the costs of the various benefits provided by Committee Print One expressed as a percentage of Bodily Injury and Uninsured Motorists loss costs:

15. AIA Study, Exhibit V, sheet 1

| | |
|-------------------------|------------|
| Medical expenses | 49% |
| Rehabilitation | 3% |
| Income loss | 82% |
| General Damages | 5% |
| Miscellaneous expenses | <u>12%</u> |
| TOTAL | 152% |
| Less Collateral sources | <u>3%</u> |
| NET COST | 149% |

Under a no-fault automobile plan, loss adjustment expenses would be less than under the present tort system. Using 12.5% of loss costs for loss adjustment expenses¹⁶ under the no-fault plan of \$.945, the following calculation indicates the cost of the no-fault system compared to the current tort system.

| | <u>Present System</u> | <u>\$.945</u> |
|-------------------------------------|-----------------------|----------------|
| Pure Loss Ratio | .550 (.55 x 1.49) | .820 |
| Loss Adj. Exp. Ratio (.19 x .55) | .105 (.125 x .82) | .103 |
| Gen. Adm. Exp. Ratio | <u>.065</u> | <u>.065</u> |
| TOTAL | .720 | .988 |

Increase in Cost for Basic (10/20 BI & UM) Bodily Injury:

$$(.988/.720) - 1 = 37.2\% \text{ increase}$$

-
16. Various estimates of loss adjustment expenses under a no-fault system have been made:

| | |
|---------------------------------------|-----------------|
| Current tort system | 19.0% of losses |
| AMIA analysis of AIA Plan | 14.5% |
| AIA Study | 11.0% |
| NY Dept. Study | 10.9% |
| Current workmen's compensation system | 12.5% |

Calculation of Income Loss as

OCTOBER 21, 1971.

Mr. ANDRE MAISONPIERRE,
Vice President and Manager,
American Mutual Insurance Alliance,
Washington, D.C.

DEAR MR. MAISONPIERRE: In your appearance before the Senate Commerce Committee on October 15th, you agreed to answer questions which the Committee submitted in writing to you. Would you be so kind as to provide answers to the following questions:

(1) In your testimony you present figures showing the present costs of bodily injury liability coverage and projected costs for the qualifying no-fault coverage in your Committee Print One (transcript 207). Would you please present the benefits which each system would deliver for those costs? Would the benefits under Committee Print One be utilized by the policyholder differently? For example, would the policyholder have to pay plaintiff attorney's fees?

(2) In your testimony (transcript 211) you conclude that certain persons would pay higher rates. What considerations did you give to the risk of loss when setting forth these categories of high loss exposure?

(3) Why would muscle car owners receive lower insurance rates?

(4) In your testimony (transcript 222) you claim that the bill would "needlessly and expensively complicate underwriting and claims administration". To what claims administration complications do you refer? To what claims administration complications do you refer? Have you assigned a less expensive cost to the claims administration procedures in Committee Print One as compared with present system? Would claims administration costs under a complete no-fault program be less expensive than those under a modified no-fault program or a mandatory first party benefit insurance reform program?

Your prompt response to these questions would be appreciated. We anticipate sending the transcript to press by October 28th. Thank you very much for your cooperation.

Sincerely yours,

WARREN G. MAGNUSON, *Chairman,*
Senate Committee on Commerce.

AMERICAN MUTUAL INSURANCE ALLIANCE,
Washington, D.C., October 27, 1971.

HON. WARREN G. MAGNUSON,
Chairman, U.S. Senate Committee on Commerce,
Old Senate Office Building, Washington, D.C.

DEAR SENATOR MAGNUSON: Your letter, dated October 21, 1971, submitting four questions related to our testimony on S. 945—Committee Print Number One on October 15, was not received until October 26. In order to meet the deadline of October 28, we are rushing these answers to you, with the understanding that had we been given more adequate time, we would have been able to develop in more detail some of the thoughts suggested.

QUESTION NO. 1

A. Comparison between qualifying no-fault benefits (Committee Print One) and present system benefits.

All available studies indicate that the overwhelming majority—well up in the ninety percentile—of automobile accident victims who receive benefits under the present system, recover on the average, considerably in excess of their economic losses. It is obvious that these innocent victims of auto accidents would receive considerably less in benefits from Committee Print Number One than they are today. The qualifying no-fault coverage of Committee Print Number One restricts benefit payments to partial economic loss of the injured. Hence, the innocent victims of accidents will have their benefits reduced if Committee Print One becomes law.

Committee Print Number One will, of course, pay benefits to all accident victims, regardless of negligence. In order to achieve this objective, the innocent accident victim is asked to subsidize those injured as a result of their carelessness in two ways. On the one hand, innocent accident victims' benefits are substantially reduced and, on the other hand, as policyholders, their insurance premiums will be greatly increased.

B. Would policyholders utilize benefits differently?

Yes they will. Benefits paid accident victims under the present system are used in a variety of ways. Obviously, an important portion of the benefits are used to pay for medical expenses and to replace wages lost as a result of accidents. In addition, a sizeable amount of present benefits are invested by accident victims who have suffered permanent injuries and who have been deprived of the enjoyment of life to compensate for this loss. The exact nature of these investments will vary from individual to individual. To the extent that the quality of life is appreciated differently by different individuals, the flexibility afforded by the present system to allow innocent accident victims to restructure their dislocated lives as they see fit, is highly desirable.

As we have already noted, the qualifying no-fault benefits would restrict accident victims to reduced economic loss benefits. However, it is still possible that the more affluent accident victims may, combining qualifying no-fault benefits and investment incomes, have sufficient disposable incomes to readjust their dislocated lives as a result of an accident. The less fortunate accident victims—the greatest bulk of victims—will have their benefits so restricted by Committee Print Number One that they will have to use all of these benefits to cover their medical and wage losses and will have no disposable benefits to readjust their broken lives.

C. Will the policyholder have to pay plaintiff attorneys' fees?

Again, the answer is yes. Whether the attorney fee is paid directly by the insurance carrier, in addition to the benefits paid the accident victim, or whether the fee is paid out of the benefits paid to the accident victim, makes no difference in the final result. Policyholder insurance premiums are a reflection of the total losses paid by insurance carriers. Whether attorney fees are added to the benefits paid accident victims or whether they are lumped into the benefits paid those victims makes no difference. Either way, attorneys' fees are losses paid by carriers and are reflected in the premium paid by the policyholders.

QUESTION NO. 2

What considerations were given to the risk of loss when setting forth categories of high loss exposure?

A great deal more consideration can be given to the "risk of loss" under a no-fault system than under the present system.

"Risk of loss" is a function of the expectations of the extent of the benefits to be paid accident victims. The present system selects accident victims on a random basis. Accordingly, under the present system, the insurance company has no control over the selection of whom he will be paying benefits to and "risk of loss" can be discounted as an important underwriting consideration.

On the other hand, this situation is completely reversed under a no-fault insurance system. Under a no-fault system, the insurance carrier knows whom his potential claimant will be and the carrier is thus in a position to protect himself against high-loss exposures. Let me be more specific:

We said in our statement, that persons who, because of their marginal skills or age, would be likely to be out of work for protracted periods (perhaps permanently) in the event of even a moderately disabling injury would be considered "high risks." Let us now assume a hypothetical accident involving, on the one hand, a laborer and, on the other hand, an executive. Both sustained identical compound wrist fractures.

It goes without saying that the laborer will have a prolonged disability following the accident. Perhaps the fracture and its resultant permanent disability may prevent him from ever returning to laboring work.

Our executive, on the other hand, may not lose one day's work as a result of the accident. He will be back at his desk, with a cast, and whether he has any permanent disability will certainly not materially effect his earnings.

The insurance carrier insuring the laborer will be paying economic loss benefits to the laborer for an extended period of time—if not for life.

The insurance carrier insuring the executive may not have to pay a single dollar in income loss replacement.

It is clear that the high "risk of loss" of the laborer must be taken into account by the insurance carrier in determining his insurance premium.

In conclusion, a system which identifies the claimants in advance, will produce rating categories and underwriting decisions based on "risk of loss" considera-

tion which have little or no relevance under the present system where the claimants are mostly randomly selected persons who get involved in accidents with the policyholder.

QUESTION NO. 3

Would muscle-car owners receive lower insurance rates?

Generally speaking, the answers would be yes. However, there would obviously be exceptions.

As stated above, the "risk of loss" would, under a no-fault system, play a major role in underwriting considerations.

There are a number of characteristics of muscle-car owners which would lead us to believe that their "risk of loss" would be less than average. Generally speaking, muscle-car owners' earnings are below average. They have little family responsibilities. Furthermore, the seating capacity of a muscle car is very limited so that again, the "risk of loss" of muscle cars is limited by the seating capacity of those cars.

We have also indicated in our statement that a consideration of "risk of loss" is the ability of the individual to recover from physical injuries. We know that young people, generally speaking, recover much more quickly than their elders.

Accordingly, we think that the majority of muscle-car owners will have a lot going for them insurance-rate wise under a no-fault system. Their "risk of loss" will be lower than average and one should expect their rates to be lower than average.

QUESTION NO. 4

Administration complications anticipated by Committee Print Number One.

We anticipate that the claim problems generated under the qualifying no-fault coverage of Committee Print One will be at least as involved as those encountered in workmen's compensation claims. It is of interest to note that some of the critics of the workmen's compensation system have accused that system of being the most litigious legal system in this country today.

We anticipate that the following disputes will frequently arise under qualifying no-fault coverage:

1. *Disability.*—The policyholder will claim that he is not able to return to work and the carrier will claim that he can.

2. *Need for further treatment.*—The policyholder and his doctor will claim the need for additional treatment whereas the carrier and its doctor will deny such a need.

3. *Relationship between disability and accident.*—The policyholder will allege that his disability is the result of the accident; his carrier will say that it is due to some condition unrelated to the accident. Or, the policyholder will claim that inability to work is a result of the accident and the carrier will claim that the inability to work is due to economic conditions.

4. *Wage expectancy.*—As we have indicated in our statement, what guideline is going to be used to determine who, among the 55% of non-employed accident victims would have entered the employment market had there not been an accident or what the economic achievement would have been a student but for the accident, etc.

5. *Fraudulent claims.*—No one can say for sure the extent to which the qualifying no-fault coverage will be abused. For instance what is there to prevent a policyholder who broke his arm tripping down a flight of stairs from claiming that he fell out of his car and broke his arm?

This incomplete list of areas which will lead to disputes between policyholders and their carriers is provided merely as an indication of claims administration problems which will arise under this coverage. Committee Print Number One makes no provision to relieve the courts from the task of deciding these disputes. One must recognize that state workmen's compensation laws, for the most part, have provided administrative tribunals to handle disputes of this nature and to relieve the burden which might be imposed upon the courts. We are convinced that if Committee Print One does become law that sooner or later, similar tribunals will have to be established to determine the compensability of qualifying no-fault coverage.

We did assign, in costing out the qualifying, no-fault coverage, a lower claims administrative factor than the one used under the present system. This was consistent with our general approach of projecting all expected losses and expenses in a most conservative fashion. The factor which we used to project

claims administrative expenses is the factor presently used in workmen's compensation claims. We believe that the similarity in claims administration problems between workmen's compensation and qualifying no-fault benefits demands the application of the workmen's compensation expense factor in costing out the qualifying, no-fault coverage of Committee Print Number One. However, we are concerned that this factor may not be adequate in view of the lack of an administrative tribunal to administer the disputes which will arise under the qualifying, no-fault coverage.

Sincerely,

ANDRE MAISONPIERRE,
Vice President.

(The following information was subsequently received for the record:)

AMERICAN MUTUAL INSURANCE ALLIANCE,
Washington, D.C., October 27, 1971.

HON. HOWARD H. BAKER, JR.,
U.S. Senate, Committee on Commerce,
New Senate Office Building, Washington, D.C.

DEAR SENATOR BAKER: Thank you so much for your letter of October 20, 1971 setting forth three (3) questions related to Committee Print Number One.

We have attached our answers to these questions to this letter.

Sincerely,

ANDRE MAISONPIERRE,
Vice President.

Enclosure.

Question: The American Insurance Association stated in its testimony that the Committee version of no-fault would result in premium cost reduction of approximately 27%. Can you explain the disparity of these figures?

Answer. The American Insurance Association (AIA) cost projection S. 945 Committee Print Number One was reached by adjusting the basic cost estimates of its own "Complete Personal Protection Automobile Insurance Plan"¹ to the benefits provided by Committee Print Number One.

The American Mutual Insurance Alliance (AMIA) Actuarial Committee publicly criticized the AIA's costing of its own plan because of inadequacies in the AIA's sample from which the raw data was obtained and because it identifies several major cost producing features in the AIA Plan which were not taken into account by the AIA in its cost calculations.²

Obviously, to the extent that the basic data used to cost Committee Print Number One by the AIA was erroneous, the cost projection of Committee Print Number One's coverage must be inaccurate.

The major errors identified by the AMIA Actuarial Committee in the original AIA calculation were:

1. The AIA failed to identify a large number of beneficiaries who would be paid under a no-fault system.
2. Survivor's benefits in death cases were omitted.
3. Income loss beyond 99 weeks of disability in permanent total injuries were also omitted.

I. THE AIA FAILED TO IDENTIFY A LARGE NUMBER OF POTENTIAL BENEFICIARIES UNDER A NO-FAULT SYSTEM

It is fundamental that any comparative study of the cost of two automobile systems, one a total liability and the other one a no-fault system, must attempt to measure the difference between the compensable injury frequency of the two systems. Because negligence is a barrier to recovery under the present liability system it follows that a no-fault system would exhibit a higher compensable injury frequency than the present liability system. And the magnitude of the frequency difference between the two systems will depend upon the frequency with

¹ Report of Special Committee to Study and Evaluate the Keeten-O'Connell Basic Protection Plan and Automobile Accident Reparations—American Insurance Association, Oct. 21, 1968.

² Actuarial Report on the Adequacy of the Costing of the American Insurance Association's Complete Personal Protection Automobile Insurance Plan—Prepared by the Actuarial Committee of the American Mutual Insurance Alliance, May 2, 1969.

which the negligence prohibition effectively applies. In other words, the increase in compensable injury frequency will, under a no-fault system, depend upon the frequency of injuries that are not being compensated for under the present liability system.

Because the AIA Cost Study used medical payment and tort liability-system generated claim files as its source of injury frequency data, they did not reveal and could not reveal the true relationship between the compensable injury frequency of the present liability system and the compensable injury frequency of proposed no-fault systems. The use of claim files generated by the present auto insurance system only serves, as it did in the AIA's study, to understate the increase in the compensable injury frequency of a no-fault automobile reparation system.

Because the increase in the compensable injury frequency of proposed no-fault plans is so important for comparative cost purposes, the Alliance Actuarial Committee attempted to estimate how many more claims would be produced if no-fault systems were adopted.

Two approaches were used: First, the Committee examined independent studies to see what other investigators had concluded about the percentage of auto accident injuries not compensated for under the present system. Second, it recalculated the compensable injury frequency indicated in the AIA Study, after making reasonable adjustments in the AIA data.

The attached Exhibit A summarizes the findings of the independent studies. It shows that different investigators have come up with wide variations in the estimated percentage of accident victims not now being compensated. However, with the exception of the Harwayne Study in New York, all of these studies indicated that the adoption of a no-fault plan would increase the number of claimants far beyond the 27% figure indicated in the AIA Cost Study.

Confirming the gross inadequacy of the AIA's projected frequency increase was the Department of Transportation's own study which revealed that only 48% of automobile accident victims had recovered benefits under the existing tort system.³ Hence, Department of Transportation would project an increased frequency in excess of 100% under a no-fault automobile compensation system.

The wide variations found in the various independent studies are related to the existence or absence of laws restricting the right of civil action against negligent drivers as between different states. Jurisdictions with restrictive laws tend to compensate lower percentages of those injured than states with less restrictive law. To the extent that the data used in the AIA Cost Study was strongly biased in favor of jurisdictions which significantly restrict the right of civil action, either by statute or by application of the common law, it is reasonable to conclude that the adoption of a no-fault system in those jurisdictions would produce increases in compensable injuries more in line with the findings of the independent studies.

For these reasons—and more importantly, the fact that four of the six independent U.S. studies produced estimates in the 55-70% range—the Alliance Actuarial Committee concluded that it would be reasonable to project a 65% increase in the number of injuries that would be compensated for under a no-fault insurance system.

II. SURVIVORS' BENEFITS IN DEATH CASES

We believe that the AIA's cost projections failed to include survivors' benefits of the nature described in Committee Print Number One.

Specifically, in its attempt to cost a no-fault automobile insurance system, the AIA valued the total income loss on 48 death claims at \$23,625. It is obvious that this nominal amount of income loss in death cases represent only the income loss incurred prior to the death and that no survivor benefits of the nature described in Committee Print One was included.

The margin error resulting from this omission is clearly evident when viewed in the light of data published by the Department of Transportation.⁴ Department of Transportation tells us that almost 30% of all compensable wage losses resulting from auto accidents are generated by survivor benefits.

³ Motor Vehicle Crash Losses and Their Compensation in the United States—Department of Transportation Automobile Insurance and Compensation Study, March 1971.

⁴ Motor Vehicle Crash Losses and Their Compensation in the United States—Department of Transportation Automobile Insurance and Compensation Study, March 1971—Table 2, p. 6.

III. PERMANENT TOTAL DISABILITY—INCOME LOSS BEYOND 99 WEEKS DUE TO PERMANENT TOTAL INJURIES

We believe that the AIA substantially underestimated the cost of providing benefits, without time limit, to those incurring permanent total disabilities. The error arises out of the AIA limiting the average duration of permanent total claims, for costing purposes, to 99 weeks.

This observation is based on the following two statements :

1. Page 9, paragraph 3, of the AIA Cost Study¹ notes that "We have made the arbitrary assumption that 90 weeks reported on the form means permanent, total disability."

2. Table A, Notes, of the AIA Cost Study appendix, explains that "Average Duration—equals the average duration in days of those injured in 'unknown and duration known' above."

Since the maximum number of weeks that could be reported for any claimant was 99 weeks and this maximum in day (63%) was used in determining the average duration of claims under no-fault insurance, it follows that, practically, all claims were costed only up to 99 weeks.

This arbitrary limitation imposed by the AIA is crucial when viewed within the context of data developed by the Department of Transportation's Study. As we have already reported to the Senate Commerce Committee's detailed study of the tables appended to the Department of Transportation's "Economic Consequences of Automobile Accident Injuries" study reveals the startling fact that only 121 persons (out of the total sample of 1,376) account for 54% of the gap between the Department of Transportation's estimate of "compensable" economic losses and the compensation received by injured victims. In short, nearly 50% of the uncompensated losses seem to stem from a small group of catastrophic situations—those crash victims estimated to have incurred economic losses exceeding \$25,000.

To the extent that the AIA has limited income loss payable to the needs of disability, it is obvious that a less severely disabled beneficiary would not be of presently unavailability of income.

28 45254 44 45254

The failure of the BIA to comply with the order was a result of a lack of funding. The cost of the BIA's operations for the fiscal year 1991 was \$1.45 billion, of which the BIA received only \$1.1 billion from the federal government. The BIA's budget for the fiscal year 1991 was \$1.45 billion, of which the BIA received only \$1.1 billion from the federal government. The BIA's budget for the fiscal year 1991 was \$1.45 billion, of which the BIA received only \$1.1 billion from the federal government.

It is further stated that the Government of the District of Columbia is not a party to the agreement and that the agreement is not binding on the Government of the District of Columbia.

The Department of Transportation has been authorized to provide economic loss resulting from automobile accidents, including property damage.

adjustment must accordingly be made to determine the actual coverage. We estimate that coverage is approximately 100 percent.

How much more, however, is the cost of the medical care that is required for the elderly? The answer is that the cost is very high. The average cost of medical care for the elderly is \$1,000 per year, or \$100 per month. This is a very high cost, especially for the elderly who are on a fixed income. The cost of medical care for the elderly is a major concern for the government and for the elderly themselves.

The first step in the process of the full \$4.5 billion program, which is being carried out by the U.S. Army, is to build a new base at Fort Belvoir, Ill. It just cannot be done.

Considering the low cost of the proposed project, the Committee has recommended that the project be approved for funding of \$100,000. The Committee has also recommended that the project be approved for funding of \$100,000.

COST ANALYSIS GUARANTEED PROTECTION PLAN, AMERICAN MUTUAL INSURANCE ALLIANCE

INTRODUCTION AND SUMMARY

This is a preliminary cost analysis of the American Mutual Insurance Alliance Guaranteed Protection Plan, prepared by the staff of the American Mutual Insurance Alliance. It follows the same procedure used by the Alliance Actuarial Committee's review and critique of the cost estimates offered in support of the

American Insurance Association's "Complete Personal Protection Automobile Insurance Plan."¹

The preliminary costs estimates of the Guaranteed Protection Plan were prepared by the Alliance staff with guidance and review by the Alliance Actuarial Committee. Data underlying the estimates were obtained from appendix to the cost study of the AIA Report, and from reports issued by the Department of Transportation in connection with the study of automobile liability insurance made by Department of Transportation.²

Information obtained from the New York Insurance Department "Actuarial Supplement to Automobile Insurance . . . For Whose Benefit"?³ was also used in making the cost estimates.

It should be pointed out that any estimate of the cost of a new automobile system involving a replacement of the tort system in whole or in part by first-party coverage is subject to a large possible error. The problem is one of determining frequency of claims and average amounts of claims under the new system. Data developed under the tort system, for example from liability claim files, are of little help in determining the frequency of claims for medical and wage loss benefits under a no-fault plan.

Using the basic data collected by the American Insurance Association and making conservative estimates of increased frequency of medical payment claims, the staff of the American Mutual Insurance Alliance estimates that the average premium cost of the compulsory coverages under the Guaranteed Protection Plan will be approximately 10% less than premium for current Bodily Injury Liability and Uninsured Motorists Coverage.

BENEFITS TO BE PAID UNDER THE GUARANTEED PROTECTION PLAN

The benefits to be paid under the Guaranteed Protection Plan on a first-party no-fault basis are summarized as follows and costs estimates in terms of current bodily injury and uninsured coverages costs are presented for each summary group. All estimated costs are expressed in terms of percentage of current B.I. and U.M. loss costs for standard limits of \$10,000 per person and \$20,000 per accident (loss costs include medical expenses, wage losses and general damages paid under the tort system).

A. Medical Expenses—45 percent of current bodily injury costs

All reasonable and necessary expenses for medical, hospital, X-ray, dental, surgical, ambulance and prosthetic services incurred within thirty-six months after the automobile accident not to exceed \$50,000 for each person injured in any one accident.

Medical expenses under a no-fault automobile reparations plan were estimated by the American Insurance Association, the New York Insurance Department and by the Actuarial Committee of the American Insurance Alliance. Using as a base for costing and for comparison with the current automobile system, bodily injury liability costs and uninsured motorists loss costs are taken as unity. Estimated costs are then expressed in terms of percentage of B.I. and U.M. Loss Costs.

Based on the AIA sample of claim files, the AIA estimated that medical expenses would be 37.9%.⁴ The New York Department estimated that medical expenses would be 37.7% using a subsample (N.Y. data only) of the AIA sample. The Alliance Actuarial Committee after careful study of the AIA data and data from other sources was of the opinion that the AIA and the New York Department had underestimated the number of injuries that would become claims under a no-fault plan. The reasons for this opinion are presented in the Alliance's *Actuarial Report on the Adequacy of the Costing of the American Insurance Association's "Complete Personal Protection Automobile Insurance Plan."* Since

⁵ AIA study, Exhibit II, sheet 1.

this report was published, the data made available in the Department of Transportation study of serious auto injury cases reveals that the Alliance projections are very conservative.⁵ Whereas the AIA had estimated that the number of persons collecting bodily injury benefits would increase 27% under a total no-fault system, and the Alliance projected a 65% increase, the Department of Transportation data indicates that only 47.7% of today's seriously injured crash victims receive compensation under the tort system. If this Department of Transportation finding were taken at face value, then the number of compensable injuries could be expected to more than double under a no-fault system. Nevertheless, we have stayed with the more conservative projection of a 65% increase.

Since the AIA had used an estimated percentage increase of only 27%, the Alliance compensable injury frequency factor was 1.30 (1.65 divided by 1.27). Applying this factor to the AIA medical cost estimate, and taking into account the Guaranteed Benefit Plan's limits of \$50,000 per person for medical and hospital expenses incurred within 36 months after the automobile accident, the AIA estimates the total costs for medical benefits would be 45% of current B.I. and U.M. loss costs.

B. Income Loss 8 percent of current bodily injury costs

Disability Benefits—80% of the loss of income from work the injured person would have performed had he not been injured, during a period commencing 30 days after the date of the accident and not exceeding 52 weeks, but subject to a maximum of \$500 per month such maximum to apply pro rata to any lesser period of work loss. In the case of a person who did not receive wages, salary, commission or other income from work, such benefits shall consist of expenses not exceeding \$12 per day which are reasonably incurred for essential services in lieu of those the injured person would have performed without income during a period commencing one week after the date of the accident and not exceeding 52 weeks.

The costs of the disability under the Guaranteed Protection Plan are estimated to be only 8% of current B.I. and U.M. Coverage. This results from the various limitation on payments for loss of wages and loss of services :

- 85% of loss of income,
- 30-day waiting period,
- \$500 per month maximum, and
- 52-week limitation on payments.

In the case of a person not receiving wages, there is a 7-day waiting period, a \$12 per day maximum and a 52-week limitation on payments. In death cases, serious cases, and cases where the medical expenses exceed \$1,000, wage losses will be covered under the tort system on a fault basis. The calculations of the cost of disability benefits under the Guaranteed Protection Plan are presented in Exhibit A.

GENERAL DAMAGES—40% OF CURRENT BODILY INJURY COSTS

The policy to be issued under the Guaranteed Protection Plan must provide for Bodily Injury Liability as well as for the first-party coverages of medical expenses and Disability Benefits. However, the B.I. payments under the Guaranteed Protection Plan will be less than under the current tort system because of the limitation on payments for general damages. The plan provides that :

A. "In any action in tort brought as a result of bodily injury, sickness or disease, arising out of the operation, ownership, maintenance or use of a motor vehicle within this state, there shall be no damages recoverable for pain, suffering, mental anguish and inconvenience, except that this limitation shall not apply in cases of death, permanent disfigurement, dismemberment, permanent loss of a bodily function and injury resulting in reasonably incurred medical expenses exceeding \$1,000."

Data from the AIA sample of closed claim files are reported in Exhibit F of the appendix to the AIA Cost Study Report, separately for non-serious cases, serious cases, and death cases. A summary of the AIA data is presented in Exhibit B to this report together with the calculations determining the effect of the Guaranteed Protection Plan limitations on general damages.

⁵ Department of Transportation: Economic Consequences of Automobile Accident Injuries, vol. 1, p. 47.

COLLATERAL SOURCES

The medical expenses and disability benefits under the Guaranteed Protection Plan would be primary for the named insured and members of his family residing in the same household. The medical expenses and disability benefits for guest passengers and pedestrians are to be excess over any other collateral benefits to which such persons are entitled. From the AIA Study, Exhibit IV, pedestrians and guests represents 25.8% of injuries and the percent of total medical expenses offset by collateral from AIA Study, Exhibit V was 31.5%. Applying these percentages to the estimated cost of medical expenses of 45% of B.I. and U.M. Costs, an estimated offset of 3.6% is calculated.

ESTIMATED TOTAL COST OF BENEFITS

The following is a summary of the costs of the various benefits provided by the Guaranteed Protection Plan expressed as a percentage of Bodily Injury and Uninsured Motorists loss costs:

| | |
|------------------------------|-----------|
| Medical expenses..... | \$45 |
| Income loss..... | 8 |
| Residual bodily injury..... | 40 |
| Total | 93 |
| Less collateral sources..... | 3 |
| Net cost..... | 90 |

OPTIONAL MEDICAL DEDUCTIBLE

The Guaranteed Protection Plan provides that the insurer may offer medical and hospital benefits to the named insured or member of his family on a Deductible basis not to exceed \$1,000. The following is an estimate of the effect on costs of a \$1,000 deductible.

On the average the cost of \$1,000 medical coverage is approximately 15% of the cost of bodily injury coverage at 10/20 limits. For example if the BI at 10/20 limit premium is \$60, the price for \$1,000 medical pay coverage would be about \$9. There would be some variation in the 15% figure state-by-state but on the average 15% of BI would be equal to the cost for \$1,000 medical.

Calculation of income loss as percent of bodily injury and uninsured motorists loss costs

| | |
|--|-------------|
| 1. Reduction because of 30-day waiting period (note 1)..... | 50% |
| 2. Reduction because of \$500-a-month limitation (note 2)..... | 11% |
| 3. Reduction because of 52-week limitation (note 3)..... | 10% |
| 4. Total reduction due to limitations..... | 71% |
| 5. Average income loss before limitations (note 4)..... | \$553 |
| 6. Average income loss after limitations..... | \$160 |
| 7. Average income loss after 85 percent limitation..... | \$136 |
| 8. Number of claims with income loss in AIA sample (note 5)..... | 1,706 |
| 9. Frequency adjustment factor..... | 1.30 |
| 10. Estimated number of claims with income loss on no-fault basis.... | 2,212 |
| 11. Estimated number of claims on a no-fault basis not subrogated
(note 6)..... | 2,024 |
| 12. Total income loss to be paid (note 7)..... | \$275,264 |
| 13. "Paid help" (note 8)..... | \$61,152 |
| 14. Total disability benefits..... | \$336,416 |
| 15. Total bodily injury and uninsured motorists costs (note 9)..... | \$4,387,379 |
| 16. Estimated costs of disability benefits (note 10)..... | 7.7% |

Note 1: Exhibit C-1 of the appendix to the AIA cost study presents data on income loss by length of disability and by size of weekly wages. A total of 1,636 injured persons suffered wage loss of \$904,185. This amount would be reduced to \$453,855 by subtracting all wage loss occurring within the first 30 days.

Note 2: After applying the 30-day limitation. Data from AIA cost study.

Note 3: From data presented in Table C-1 of AIA cost study, after applying the 30-day limitation and the \$500 maximum.

Note 4: \$904,185 divided by 1636, AIA Report, Exhibit C-1.

Note 5: AIA Report, Exhibit II, sheet 1, line 5.

Note 6: From Exhibit B, 17.5% of the 6,255 cases would be serious, death or over \$1,000 medical. Assuming that half of these would be subrogated the total number of claims on a no-fault basic net subrogation would be 91.25% of 2,218.

Note 7: 2,024 times \$136.

Note 8: (663) (1.30) (.55) (.60) (\$215) = \$61,152.

Where: 663=number in AIA sample having "Paid Help"

1.30=Frequency adjustment factor

.55=Ratio of non-wage earner

.60=Ratio of injured for period less than 7 days

(from Table C-1 of AIA Study)

\$215=Average amount for "Paid Help" from AIA Study.

Exhibit II, sheet 1.

Note 9: AIA Report, Exhibit II, sheet 1.

Note 10: \$336,416 divided by \$4,387,379.

EXHIBIT B

| Number of claims..... | 6,255 | | 1,095 | | |
| Medical expenses..... | | 1,473,286 | | 0 | |
| 10/20 B.I. payments ² | | 6,466,510 | | 2,557,644 | 3,908,866 |
| Reduction costs (percent)..... | | | | | 60 |
| Bodily injury costs under guaranteed protection plan (percent)..... | | | | 40 | |

¹All medical expense has been costed under the first-party no-fault medical coverage. The residual B.I. cost will be greater than 40% to the extent that medical expenses will be subrogated. However, if there is subrogation the first-party costs will be less and the estimated cost of the total package of coverages unchanged.

²In making the B.I. cost estimates, a \$1,000 economic loss threshold was used instead of a \$1,000 medical expense threshold. This would tend to make the cost estimate somewhat over stated. However, with the increase in medical expenses since the period of time during which the AIA Study was made, a greater number of cases would meet the \$1,000 threshold now than would be the percentages of cases in the AIA sample.

Source of Data: Table F-3 and F-4, Appendix to AIA Cost Study Report.

Question. Several States have adopted various versions of no-fault insurance. Would you supply for the record your analysis and reaction to any or all of these programs.

Answer. A complete analysis prepared by Prof. Bernard L. Webb, Georgia State University, Atlanta, Georgia, of the various versions of existing no-fault insurance programs is attached.

We do have a number of comments to make on these laws.

MASSACHUSETTS

We supported the enactment of this law in Massachusetts as an affirmative response to the abuses existing in Massachusetts, prior to January 1, 1971, in the compensation system. Two of the principal abuses were:

1. The very large number of bodily injury liability claims pressed by motorists.
2. The very large proportion of claims—including many small ones—which were attorney represented.

We do not believe that the Massachusetts law would be the type which should be enacted in other jurisdictions because the abuses described above do not exist to the degree then present in Massachusetts.

DELAWARE

We neither supported or opposed the enactment of the Delaware law. While we favor the compulsory no-fault benefits now to be required, we were not certain that the restriction in the evidentiary rule with respect to actions for general damages would result in premium cost stabilization or reduction. However, as we have stated repeatedly, we believe in state experimentation in order to determine which are the workable and responsible types of reform and we look forward to the experience which the Delaware law will generate.

FLORIDA

The Alliance opposed the Florida law primarily for these two reasons:

1. The insurers right of subrogation is abrogated to the extent of the tort exemption—a maximum of \$5,000 for bodily injury and \$550 for property damage with certain exceptions. This results in the ultimate cost of accidents which fall within this range of damages being shifted to innocent motorists in many instances. Internally, insurers will have to devise a radically revised classification and rating system once the claims data is available.

2. A tort exemption for property damage losses up to \$550 places an unfair dilemma upon owners of older cars. That is, whether to transfer the risk, and pay a substantially higher total collision premium, or run the risk of an extensive out-of-pocket loss. This situation will by no means be a rare one. The majority of autos in the state are over 3 years old, and most property damage losses are within the \$550 range.

ILLINOIS

The Alliance strongly supported the enactment of this law. We believe that this type of reform affirmatively responds to the abuses in the present fault system without abrogating present tort rights. At the same time, cost stabilization or reduction is achievable by abolishing the overpayment of general damage recoveries in the non-serious cases.

MINNESOTA-SOUTH DAKOTA

The Alliance believes that these two laws, while not harmful, do not represent an adequate response to the need for reform of the present system. They are not harmful because the additional premium cost will only apply to those policyholders who elect the no-fault benefits option. However, if all auto accident victims should receive benefits (as we believe they should), there should be no option to purchase them. The benefits should be mandated.

OREGON

This law does mandate no-fault benefit purchase by insurers. However, this necessarily results in an increase in the premium of the average auto policy. Therefore, the Alliance additionally recommended to the Oregon legislature a restriction on general damage recoveries in order to respond to the over payment of nonserious injury claims as well as to stabilize or reduce average premium cost. The legislatures did not feel the average policy price was a point of criticism in that state. However, we believe that some reform with respect to actions for general damages would have allowed for a no-fault benefit level more in line with acceptable standards.

Senator BAKER. At this point, we have one other additional scheduled witness. I am going to recess the hearings briefly, subject to the call of the Chair. It is my hope that we will be able to resume again shortly.

The hearing will be recessed temporarily.

(Short recess.)

Senator STEVENS (presiding). The committee will come to order.

Mr. McGowan, I am sorry to have kept you waiting.

STATEMENT OF ROBERT V. MCGOWAN, PRESIDENT, NATIONAL ASSOCIATION OF MUTUAL INSURANCE AGENTS; ACCOMPANIED BY WILLIAM A. STRINGFELLOW, GENERAL MANAGER

Mr. MCGOWAN. That is perfectly all right. I recognize there is other business going on at this time.

Mr. Chairman and gentlemen of the committee, my name is Robert V. McGowan, of North Attleboro, Mass. I am the owner of the R. V. McGowan Insurance Agency, Inc., in North Attleboro. I am appearing here today as the current president of the National Association of Mutual Insurance Agents, an organization of more than 18,000 independent property and casualty insurance agents with members in nearly all States and with headquarters in Washington, D.C. Accompanying me is the general manager of the National Association of Mutual Insurance Agents, William A. Stringfellow, CPCU.

As you will recall, I appeared before your committee previously on May 4, 1971, when the committee was considering S. 945, the National No-Fault Motor Vehicle Insurance Act; S. 946, the Motor Vehicle Group Insurance Act; and S. 976, the Motor Vehicle Information and Cost Savings Act. Today, however, I will present my association's views on Committee Print No. 1 of S. 945, pointing out what we consider the major strengths and weaknesses of the new measure.

I would like to first mention those areas where we feel Committee Print No. 1 is superior to the original bill. We are pleased that benefits under the policy would be primary—that is, the amount paid would not be reduced by benefits paid from other sources. However, we do not agree that an exception should be made for collateral benefits provided under any form of public health insurance. We see no justification for making the general public in effect pay for benefits of the driving public. If automobile insurance is considered secondary to health insurance, this is exactly what would happen.

The 25-percent limitation on attorney's contingent fees is, in our opinion, a strong addition to Committee Print No. 1. Such fees have a place in our legal system, but because they are sometimes abused by a segment of the legal profession, they must be properly regulated in order to bring about meaningful reduction in the cost of automobile insurance. We commend highly this provision.

In our opinion, there are four key areas of Committee Print No. 1 which we find particularly objectionable because they will almost surely lead to high costs which will ultimately have to be paid by the policyholder. In many instances, the revised bill fails to clarify definite areas of concern. Adoption of such a vague bill on the Federal level

would undoubtedly lead to a great deal of confusion throughout the country. I would like now to describe those four areas and present to you the reasons we feel they will lead to prohibitive costs.

INCLUSION OF PROPERTY DAMAGE

To include property damage under the no-fault provisions as outlined in Committee Print No. 1 would, in our opinion, not cut costs but at best simply redistribute them. While it can be argued actuarially that eliminating general damage recoveries under bodily injury could produce some cost savings, we see no evidence that including property damage under no-fault would lead to such savings.

HERE IS WHY

Under present auto insurance policies, the insured can elect to take collision coverage to pay for actual damage to his own car or, as is often the case when the car becomes 5 years old or older, the policyholder simply elects to drop the coverage, or "self insure," because the premium is too great in comparison to the car's actual value. However, if another driver is at fault the policyholder still has the right to recover his loss.

According to Committee Print No. 1, the policyholder must either accept the coverage—even if his car is 5 years old or more, as some 40 percent of all autos are today in Massachusetts—or elect not to take the coverage. If he chooses the latter, of course, he has no means of recovery whatsoever since tort actions are prohibited.

I should point out here, Mr. Chairman, that this very situation will adversely affect millions of average middle American car owners who always afford new cars. If they now will be forced to take pay an inordinate premium for very limited coverage, or better yet, in the justice of no recovery at all when they are at fault, they will be a paid driver.

In the same vein, rates for no-fault policies today are computed with the assumption of a percentage recovery in the tort system. This tends to reduce rates for no-fault policies. If the tort system were to result under Committee Print No. 1

WHAT IF NO-FULT?

Committee Print No. 1 states that the no-fault system would be paid to automobile accident victims and their families. This is spelled out. When a car accident occurs, the victim's family is stored. If the victim is killed, the family is paid a lump sum of "making up" the family's income.

We are concerned that the no-fault system would be paid to No. 1 that the no-fault system would be paid to the family as follows:

All appropriate and necessary medical, hospital, and medical professional services, including the cost of any medically necessary and reasonable expenses for transportation, therapy and other services.

I ask you, who will decide the extent of injury in the event of disagreement? The only recourse a person will have is the courtroom. The inevitable result: soaring costs to be borne by honest victims and policyholders because there is no check on the malingering individual. This is one of many questions that will increase—not decrease—court congestion.

Under the plan for reform of the automobile reparations system developed by our association, entitled "Motorists' Insurance-Protection Plan," we propose that all automobile liability insurance policies include: payable immediately regardless of fault, medical and hospital expense coverage up to \$2,000—subject to an optional \$250 deductible—with tort action above that figure.

Such a limitation would help to keep costs down, but not deprive the victim of his legitimate benefits. I should point out in this connection that even under the original S. 945 the single driver under age 25, who under present rating procedures is statistically the poor risk, actually becomes the preferred risk, while the driver with a spouse and children suddenly becomes the high risk. This would increase the cost of insurance to the family man who now shoulders the greatest financial burden in the country in the area of taxes, education, et cetera.

Under a total no-fault system as proposed in Committee Print No. 1, insurance rates would be lowered for the careless young drivers who statistically cause most accidents, but premiums would be raised for the over-age-25 family drivers who statistically are more careful, but who are more likely to suffer greater injury and greater economic loss.

UNLIMITED WAGE REPLACEMENT

Rather than permitting wage replacement benefits to be paid indefinitely, as called for in Committee Print No. 1, I would like to again refer to our association's proposal: "Disability coverage of 85 percent of gross income lost, commencing 30 days after the accident and continuing for 52 weeks and subject to a \$500 per month maximum or a total of \$6,000."

Again I ask, who is going to determine lost wages, and I quote from the committee's print, "anticipated annual compensation," with regard to a 5-year-old child who becomes totally disabled? Who is going to determine the condition of a housewife who might need psychological therapy? Should this housewife be a college graduate who has taken a few years leave from her profession to rear children, who will decide her, and again I quote, "anticipated annual compensation"? If a reasonable time limit is not placed on payment of wage loss benefits, it seems likely that the cost of no-fault coverage will be unaffordable to a majority of the insurance-buying public, especially to the good risk.

EXCESS DAMAGE COVERAGE AT OPTION

Committee Print No. 1 makes excess damage coverage optional. In this case, the policy pays for intangible loss, pain and suffering, et cetera, as measured by the State tort law. As such, you are still faced with one of the major problems in our present reparations system—the tendency to overdramatize and exaggerate pain and suffering and other similar intangible losses.

This is not to say, however, that we agree with those who would abolish these recoveries altogether. Thus, we feel that some of these

criteria is needed in determining pain, suffering and inconvenience, placing reasonable limitations on the less serious cases.

Our association's proposal suggests the following standards for intangible loss:

Up to 50 percent additional damages when medical and hospital expenses amount to \$500 or less;

Up to 100 percent additional damages when medical and hospital expenses exceed \$500;

In case of death, permanent disfigurement, loss of limb, permanent loss of bodily function and, other exceptional circumstances, these standards may be raised by the courts.

Until a better means of determining such damage is conceived, we believe these standards will provide reasonable safeguards and prove fair and equitable to all concerned. At the same time, it will tend to keep costs in line.

We are convinced there would be a substantial increase in cost to the insurance-buying public if Committee Print No. 1 is adopted in its present form.

Finally, Mr. Chairman, I would like to reiterate the basic position of our association on the entire matter of automobile insurance reform. While we agree that our present system needs improvement, we do not agree that it should be scrapped altogether—at least without allowing the opportunity for testing new approaches.

Since your original hearings last May, six States—Delaware, Florida, Illinois, Minnesota, Oregon, and South Dakota—have joined Massachusetts in enacting various forms of no-fault insurance.

In addition, some 24 others are considering some type of no-fault plan. They differ in some ways, but represent what the legislatures of those States feel are best for their citizens. And that is exactly our point. Given the chance to observe and evaluate these various plans, offers us a sound, evolutionary approach to improving the auto insurance system on a State-by-State basis.

Accordingly, we respectfully urge this committee to work for a concurrent resolution expressing Congress' intent that the several States adopt reform measures based on their own particular needs, but stipulating minimum criteria for first party coverage.

Given enough time, we are confident that the States will act responsibly to improve auto insurance. At the same time, however, we do feel that the Congress can take another look at the situation in, perhaps 2 or 3 years, to determine what has or has not been done.

This approach would allow the several States ample time to make such improvements in the auto insurance system as they deem necessary, and Congress to fulfill its responsibility to the American motoring public.

Thank you, Mr. Chairman, for allowing us to share with you our thoughts and suggestions on the very important legislation now before you.

SENATOR STEVENS. Thank you very much, Mr. McGowan.

I have one question, and I understand the previous chairman stated that in the interest of time, he was going to request witnesses to agree to respond to questions submitted to them in writing.

That would be agreeable with you, I am sure?

MR. MCGOWAN. We would be happy to do that, Mr. Chairman.

Senator STEVENS. I notice in your first comment about the inclusion of property damage you did not point out what your association suggests.

On the other items, disability and unlimited wage replacement, and your concept of excess damage, you have made specific suggestions.

What is the suggestion of your group as to the first item, property damage?

Mr. McGOWAN. Mr. Chairman, our association has not taken a formal position on no-fault property damage as such, except for the comments that I have made here today. In other words, they have not taken a position as an alternative to the present system.

Frankly, we do not see any opportunity to improve the public's position by so-called first-party property damage approach. As I said, we think you would just simply redistribute the cost.

Part of the cost would be distributed to the public in the form of deductibles, part of it is certainly distributed to a very substantial segment of the driving public, as I mentioned the driver with the car 5 years old or older.

We have—and we have made our position very strongly—agreed with the committee's proposed bill on changing or modifying the extreme vulnerability of automobiles to damage. We feel that this needs to be done. We feel this is where substantial savings can be offered the general public in property damage claims.

Senator STEVENS. What you are really saying is you don't want to include property damage under no-fault in any event?

Mr. McGOWAN. That is correct.

Under your proposal, for example, or other proposals which are already in some cases law, or about to become law of the States, you have an actuarial basis for reducing costs, because you do, in effect, reduce benefits.

In Massachusetts, for example, you cannot sue for pain and suffering unless you have at least \$500 of medical expense and, actuarially, a study was made before the bill was passed, which indicated that \$150 threshold over 5 years previously in Massachusetts would have reduced rates for bodily injury by 22 percent.

If that is true, certainly the \$500 threshold we have now should produce a savings of 22 percent, plus. And this seems to be proving out in the early stages, at least.

The 15 percent savings built into the law seems to be producing net profits for the companies which will have to be adjusted in 1972. But there is no provision in your committee print which offers any actuarial basis for savings of property damage costs at all.

You proposed, and I don't want to be repetitious, to redistribute them, I think unfairly. I think it is unfair to say to a driver who owns a car 5 years old, that is worth \$700 to \$900, that he must, depending on the territory where he is, that he must spend \$150 to \$300 a year to buy deductible collision insurance. You see, that type of driver is not apt to be accident prone. We have many of them in our agency.

We also call their attention to the fact that their car is worth only so much money in 5 years, do they want to spend that percentage of its total value to insure it?

And invariably, they will elect not to carry the collision insurance, but will continue to carry the comprehensive insurance, which is \$4 to \$18 a year, protecting him against broken windshields, fenders,

and very often make the comment, "I have never had an accident, except I was rearended or I was struck by somebody coming from a stop sign, in which case I can collect from the other driver."

You are going to take away this right to do that. You are going to say, you can't collect anymore. Either you buy collision insurance, or you risk exposing your car to a total loss.

I think that is unfair to a segment of the economy that can probably least afford to have that kind of choice presented to them.

Senator STEVENS. You make the point that the family driver over age 25 is more likely to suffer greater injury and greater economic loss.

Do you have anything to bear that out?

We have been told statistically that the driver under 25 is a poorer risk. We have never been told, to my knowledge, that the family driver is a greater economic risk in terms of insurance.

Mr. McGOWAN. But you propose, Mr. Chairman, to change the rules.

Under the present rating procedures, you are correct, that the under-25, statistically, the under-25 male, single driver, causes the most accidents—

Senator STEVENS. Wait a minute. I always understood he was a greater economic risk, and for that reason you charged him higher premiums.

Mr. McGOWAN. We weren't worrying about what was happening to him. We were worrying about what he was doing to somebody else.

In other words, you are insuring his liability—you weren't insuring him personally—so he could hit the family driver with the wife and three children, who is making \$25,000 a year, and causes a substantial insurance loss.

Now, under your proposed changes, you don't really care what he does to anyone else, because you are not going to have to pay for that out of his insurance policy.

All you are going to have to pay is for his economic loss. The chances are his income level is either low or nonexistent. You are going to have to pay for his hospital and his medical expenses and his rehabilitation.

But the family man, now, with the three children and the wife, with the \$25,000 income, who this young man hits, now his insurance company is going to have to pay him and he is the large exposure. They are going to have to pay all his hospital and medical expenses, his income loss, his possible future income loss. So, you are shifting your exposure.

Do you understand what I mean, Mr. Chairman?

Senator STEVENS. I understand, but I would like to see some statistics on that.

It would seem to me that the underage driver has got the longest period of time to receive compensation, if you are looking toward anticipated income loss, or the other comments that you made about wage replacement.

Secondly, it seems to me that the underage driver has probably more exposure to accident than the family man who drives back and forth to work.

Again, I am just speaking from my limited experience. I think the committee would like to have some statistics on this.

What type of accident has this underage driver been involved in?

Has he been hitting cars with families in it, or has he been doing

what a lot of other people think he has been doing: racing with his buddies and running into another car with another underage driver in it?

Mr. McGOWAN. We will be glad to develop whatever figures we have on that.

From my experience, I will tell you, this young man has been doing both of these things. He has been wrapping his car around trees in collisions with himself, and he has been running across the road in head-on collisions with family men and kids.

Actually, the loss revenue on this under-25 driver in our State is 174 percent of the loss ratio of all drivers in the State.

Senator STEVENS. You may have explained something to me, because I notice a great reluctance of those companies who have preferred risks to go along with this type of no-fault insurance. Maybe that is the reason. I have never heard it expressed before.

Mr. McGOWAN. I have discussed this with some company presidents, and some company actuaries, and they all concede that under a complete no-fault system—and that is why in Massachusetts, incidentally, the bill there was developed by insurance agents originally, and we supported the legislation and naturally spent a lot of time studying it, and some of the reasons we put on the \$2,000 limit is because we showed that would take care of 95 percent of all accident victims, and we thought it would tend to mitigate this problem that would be perhaps socially unacceptable to the public that the good driver would acquire the increase in the rates.

Somebody earlier pointed out the experience in Manitoba. Sixty-six percent of all the drivers experienced a rate increase under the pure no-fault system, and 33½ percent experienced a rate decrease.

We think basically the same thing will happen here.

Being very sensitive to public attitudes toward insurance anyway, we thought once the public found this out, the image of the insurance industry would be worse than it already is, if that were possible, and this is why we thought it was possible that the \$2,000 limit would tend to mitigate that kind of a problem. You don't shift the burden of exposure.

Senator STEVENS. Are you telling me you are the ones who are wearing black hats?

I thought it was the lawyers who were wearing black hats now, not the insurance companies.

Mr. McGOWAN. That is true, Mr. Chairman.

Senator STEVENS. Thank you, very much.

We will recess until tomorrow morning at 10 o'clock.

(Whereupon, at 3:20 p.m., the hearing was adjourned, to reconvene at 10 a.m., the following day, Thursday, October 14, 1971.)

(The following information was subsequently received for the record:)

OCTOBER 20, 1971.

Mr. ROBERT V. McGOWAN,

President, National Association of Mutual Insurance Agents, Investment Building, Washington, D.C.

DEAR MR. McGOWAN: Pursuant to the stipulation regarding supplemental questions at the Commerce Committee hearings on S. 945, I am submitting the following for your attention:

1. The American Insurance Association stated in its testimony (copies of which are available to you) that the Committee version of no-fault ~~will be~~

sult in premium cost reduction of approximately 27 percent. Can you explain the disparity of these figures?

2. Your organization has developed a proposal for no-fault insurance. Can you provide a detailed cost evaluation of this program?

3. Several states have adopted various versions of no-fault insurance. Would you supply for the record your analysis of and reaction to any or all of these programs.

Thank you for your assistance and for your excellent testimony at these hearings.

Yours truly,

HOWARD H. BAKER, Jr.,
U.S. Senator.

NATIONAL ASSOCIATION OF MUTUAL INSURANCE AGENTS,
Washington, D.C., January 18, 1972.

HON. HOWARD H. BAKER, Jr.,
U.S. Senate,
Washington, D.C.

DEAR SENATOR BAKER: I am writing in response to your letter of October 20, 1971, requesting answers to several questions relating to the October 13 and 14 hearings of the Senate Commerce Committee on Committee Print One of S. 945.

You asked us to comment on the testimony by the American Insurance Association, which stated that the Committee version of no-fault would result in premium cost reductions of approximately 27 percent.

It is our opinion that the American Insurance Association made a number of questionable assumptions to arrive at a 27 percent premium reduction in Bodily Injury:

(1) AIA concluded that the exclusion of pain and suffering from the basic mandatory coverage would reduce costs.

(2) AIA believes that the President's efforts to stabilize the economy in Phase II will control increasing medical costs enough to reduce premium rates on the bodily injury portion of the auto insurance policy.

(3) AIA has said that although the number of claims will increase, the size and frequency of claims will decrease. This is based on the assumption that the automotive industry will build damage-resistant cars in the near future.

In addition, it seems to us that the AIA has failed to consider certain categories:

(1) AIA does not take into account income loss beyond 99 weeks;

(2) AIA does not include survival costs in death benefits;

(3) AIA has not figured income due when a partial injury occurs;

(4) AIA has not considered unlimited medical, rehabilitation, lost wages, and the possibility of malingering.

Also, and perhaps most important, under an unlimited no-fault system, such as proposed by Committee Print One, everyone collects, regardless of who was at fault. Under our present tort system, the person at fault does not collect. Thus, with an unlimited no-fault system, whereby every person collects, the cost will increase substantially.

Conversely, our Association believes the position taken by the American Mutual Insurance Alliance is far more valid. According to the AMIA, the average premium for bodily injury would be 37 percent greater than present rates because of the following:

(1) The number of persons collecting bodily injury benefits under a complete no-fault system will increase;

(2) The average claim size and frequency are questionable to say the least;

(3) Wage replacement is an unknown factor;

(4) The difficulty in filing claims with rehabilitation expenses;

(5) Eliminating fault does not eliminate losses incurred in accidents;

(6) The need for more rating distinctions. (Under the Hart-Magnuson bill, rating would be based on damage the individual vehicle and driver would sustain, rather than the damage he would do to another vehicle.)

You asked us to provide a detailed cost evaluation of our proposed program. Because of the number of assumptions that must be made to reach any meaningful cost figures, and because our program has not been actually implemented in any state, we feel it is impractical to cost out our "Motorists' Insurance-Protec-

tion Plan" at this time. However, because the present limited no-fault system currently operating in Massachusetts is extremely close to our proposed program, perhaps it would be helpful to look at the cost experience so far there. With a system of basic first party benefits, costs reportedly have come down substantially.

In answer to your third question, relating to an analysis of and reaction to any or all of the various state programs of no-fault, I would like to submit for the record a copy of a speech I gave before the Pekin Insurance Company's convention in Florida. As you will note, I covered all of the state programs which became law on January 1, 1972.

I trust that this will give you the additional information that you requested in your letter. If you have any further questions, I will be happy to answer such in writing or talk further with you and your staff.

Again, thank you for your interest. I am looking forward to working further with you in order to accomplish auto insurance reform.

Very truly yours,

ROBERT V. MCGOWAN,
Immediate Past President.

Enclosure.

AN EXPLANATION OF THE VARIOUS "NO-FAULT"-PROPOSALS

by Bob McGowan

An in depth analysis of the history of "No Fault" auto insurance and the various plans adopted and proposed in The Congress and by the states of Florida, Delaware, Illinois and Oregon. A real primer for the local independent agent that can be used as the basis for service club speeches in your own community.

I have been asked to give you a comprehensive analysis of the present status and outlook of the automobile reparation system with particular emphasis on the so-called "no fault" concept. I have long felt that it was unfortunate that the word "no fault" became the widely accepted terminology for a first party benefit system. My concern was based on the deep-rooted philosophy in American Society that there is a difference between right and wrong, and if one man carelessly injures his fellow man by wrongful conduct, the wrongdoer should be liable for the losses he has caused by violating the rule of careful conduct.

All of us are distressed over the poor image the public has of our industry. One cannot help but wonder about the psychological effect on the careful driver, who, while patiently waiting for a red traffic light to turn green, gets resoundingly rear-ended by some character who was busy changing the cassette in his tape deck. I can visualize him painfully extracting himself from the car, nursing his bruised muscles and viewing with dismay his crumpled automobile—his pride and joy, the extension of his personality, his most treasured and essential personal possession. At this point, the malefactor apologizes, expresses the hope that our innocent victim has adequate "no fault" bodily injury and property damage coverage, and blithely goes off about his business. At that time and place, I wonder how much enthusiasm our friend the careful driver will have for the "no fault" concept. However, the term has been given such widespread repetition by the media and politicians that it is here to stay.

Like many other new ideas, the concept of no fault is not at all new. Judge Robert Marx of Cincinnati proposed that auto victims be compensated in the same manner as workers under workmen's compensation way back in 1925 when he participated in a Columbia University study on the subject. This theory cropped up periodically through the years but no one paid much attention to it until 1965 when Professors Keeton and O'Connell wrote a book in which the term "no fault" was born. Essentially, they proposed a first party coverage up to \$10,000 and third party liability thereafter.

This book had a tremendous impact because it arrived on the scene just at a time when—public dissatisfaction over the automobile reparation system was beginning to attract the attention of both the news media and the politicians.

The public's displeasure was grounded on three major causes:

First of all was the increase in cost. Actually this fact was blown up out of all proportions by the politicians and the columnists. There were significant increases in rates to be sure but many other elements of cost price structure were escalating even more dramatically and some of these elements were having the

astrous effects on the cost of claims. However, the politician apparently did not think attacking these other elements was politically popular and he zeroed in on insurance costs as did the commentators.

The second cause of public disenchantment was the practice (since pretty much abandoned) of not paying for property damage in cases of clear liability unless the claimant settled his bodily injury claims first or simultaneously. This practice, combined with the custom of many companies to withhold payment of medical expenses until the entire claim was finally settled, laid the foundation for many of the industries' present troubles. Of course, in recent years, most companies adopted the procedure of paying for property damage claims immediately in cases of clear liability and also made advance payments in out of pocket expenses on bodily injury. But it was too late.

Finally, the public was completely frustrated by the long delay in collecting claims because of court congestion and disagreements over contributory and/or comparative negligence. In some cases the difficulties in proving the claim resulted in no recovery at all. The public seemed reasonably willing to accept these delays in the more serious cases of bodily injury, but was not willing to put up with it on the smaller cases. When you consider that 95% of all bodily injury settlements are under \$2500 you can readily see that the great majority of claimants were unhappy.

In my experience the two latter causes far out-weighted the question of cost in the public's mind.

Thus, the stage was beautifully set not only for the would-be reformers outside of the industry, but for a rapid escalation of government interference in the insurance business.

Where then do we find ourselves at the present time? Some form of no fault insurance has become law in seven states and is under consideration in 29 others. Furthermore, Senator Hart's "pure" no fault legislation is under serious consideration in the Congress, and the Nixon administration is expected to come out soon with a model bill for the states which will also probably advocate pure no fault.

Massachusetts, which was the first state to adopt the no fault approach, and is the only state in which we have any actual experience, the other statutes do not actually go into effect until January 1, 1972. The Massachusetts law is not pure no fault but is true no fault up to \$2000 in medical expense and wage loss because the claimant is not permitted to recover from the other party within those limits, nor is the claimant allowed to sue for pain and suffering unless his medical expenses exceed \$500, or unless he suffers loss of sight or hearing, loss of a body member, permanent and serious disfigurement or fracture, or the accident results in death. In this provision lies the secret of the spectacular drop in claim dollars and frequently in Massachusetts so far.

The Massachusetts law, called Personal Injury Protection, was conceived and filed by the insurance producers in that state and was at first opposed by the insurance companies. However, an actuarial study by a major insurance company revealed that a minimum medical expense threshold of \$150 before suits for pain and suffering were allowed would have produced an average premium reduction of 22% over the previous five years in Massachusetts. I know of no actual study of the effect of a \$500 threshold, but obviously it has to be some thing in excess of 22% and this seems to be borne out so far in actual experience. A review by the Massachusetts Insurance Department of claim files of 61 companies writing 96.4% of the auto business in the state show for the first six months of 1971 compared to the same period in 1970 a reduction of 52.2% in the average cost of claims and a reduction in the number of claims for the same period of 34%. I think you will agree that this is a spectacular result. The drop in claim frequency is actually baffling. The rate structure contemplated a 30% increase in claim frequency which seems logical when you consider almost everyone is going to get paid regardless of fault up to the \$2000 limit. The law does exclude benefits for those under the influence of drugs or alcohol, those committing a felony or fleeing lawful apprehension and cases of intentional injury to self or others. No one has come up with any meaningful answer to this phenomenon but it certainly is not making anyone unhappy. Of course, the entire future results of no fault can by no means be predicated on six months experience, but, while the percentage may change, everyone agrees the reduction in claim dollars will still be substantial.

Perhaps even more important from the viewpoint of the political effects in our business is the degree of satisfaction displayed by claimants. Companies,

mindful of the chaotic situation in our state in 1970, have concentrated on speedy claim settlements to such a degree that most claims are being paid within a week after submission of medical bills or evidence of wage loss. This is the greatest public relations vehicle the industry could have and one would hope that they continue to pay claims rapidly.

Other features of the law in addition to medical expenses include reimbursement of 75% of lost wages subject to deduction for benefits received under wage continuation plans or workmen's compensation and also subject to the same \$2000 limit. Benefits are also provided for payments to others for service injured parties would have performed for himself or household.

The Massachusetts legislature has just passed a complicated no-fault property damage law which I fear may get an adverse reaction when the public finds out what it has. The law eliminates liability for damage to any Massachusetts registered automobile but retains liability for damage to out-of-state automobiles and property other than motor vehicles. Unlike the no-fault bodily injury statute there is no actuarial basis for reduction of claims on the property damage. The bill merely re-distributes the costs.

The owner of a Massachusetts car now has three options. He may choose to carry protection similar to his present property damage liability and collision insurance except he would always collect from his own company and would have no right to sue a negligent driver. Under a second option he could collect for damage to his car only if it were parked or if there was clear negligence on the part of the other driver such as a rear end collision or if there were a conviction for being under the influence of drugs or alcohol. Under his third option he could never collect for damage to his car but would be protected for liability for damage to property other than motor vehicle. 53% of all registered cars in Massachusetts are 5 years old or older, and when these people find out that they must now carry collision insurance or suffer a total out of pocket loss when involved in an accident where they were not at fault, I suspect the industry's image will suffer another blow. A substantial segment of the industry is opposed to the law, but we will all be blamed for it anyhow.

So much for Massachusetts. The only other statute that contains a true no fault provision is the Florida law. All of the other state laws passed so far retain true liability in full, but provide for an offset of first party benefits against any settlement under tort liability. The weakness in this approach is that costs in these states may well increase over present rates. If this happens the political effect could be adverse.

Like Massachusetts, the Florida law is compulsory, and provides a \$500 maximum first party benefits for both medical expense and wages. The plan reimburses for 100% of gross wages. Suit may be entered for pain and suffering if medical expense exceeds \$1000, or there is serious injury similar to the provisions of the Massachusetts law. Florida also has no-fault property damage. This is not compulsory and if no insurance is carried a car owner can only recover in tort only if damage to his vehicle exceeds \$550.

Delaware's law provides first party benefits up to \$10,000 per person or \$20,000 per accident, on a compulsory basis. There are no restrictions on suits for pain and suffering.

Illinois provides first party medical expense up to \$2000 and wage benefits based on 85% of income subject to a maximum of \$150 per week for 52 weeks. There is no restriction on suit except that recovery for pain and suffering is limited to 50% of medical expense if it totals \$500 or less and 100% of medical expense if it is over \$500. These restrictions do not apply in the event of permanent disability, dismemberment, permanent service disfigurement, or death.

Oregon has a \$3000 limit on medical expense and pays loss of wages up to 70% of gross, maximum of \$500 a month for 52 weeks. There is no restriction of any kind on suit under tort liability.

Now we come to Senator Hart's proposal in the Congress for a pure no fault reparation plan which would be under the jurisdiction of the Federal government and, if it passes, will almost certainly lead to complete Federal government regulation of auto insurance. When we say "pure" no fault we mean the bill completely eliminates tort liability.

The benefit structure calls for the payment of all expenses without limit for medical and psychiatric treatment, physical and occupational therapy and rehabilitation. For wage loss the plan would pay 100% of gross earnings after taxes, with a maximum \$1000 a month, for as long as the insured is disabled. No re-

covery for pain and suffering is provided under the bill but companies would be required to offer such coverage as an extra-cost option as well as wage replacement over the \$1000 a month. For an unemployed person or one not regularly employed, or for the self-employed, the plan would pay on the basis of the "anticipated annual income" of such person. The plan would be compulsory.

The bill has a strange quirk. While it prohibits recovery for pain and suffering on the part of the owner of a motor vehicle, or his spouse or dependents, it allows any other passenger *carte blanche* in general damages as well as first party benefits. This favored group will include persons of considerable wealth who live in large cities and have given up trying to drive or park a car in the metropolis. It will also include the very poor, who cannot afford even the oldest used car, and doubtless some elderly widows who never learned to drive. If a member of this select group is injured by an automobile, regardless of the circumstances, the insurer must pay all wage loss, all medical, and full tort damages for disability, disfigurement and pain. These benefits are "free". No member of this class ever pays a nickel in premiums. The cost, of course, will have to be charged to owners of vehicles.

The bill also requires the insurer to offer coverage for damage to the insured's automobile. This coverage is not compulsory, but the insured is precluded from recovering from any other party.

Speaking of costs, objective analysis indicates that because of unlimited benefits and wage provisions which will encourage malingering the cost will be substantially higher. Actuarial studies by the American Mutual Alliance indicate an increase of between 37% and 100% depending on the optional coverages purchased by the insured.

In addition to total cost, a pure no fault system will have a rather strange effect on distribution of cost. Under the present rating system the premium reflects the risk that the particular driver will cause the loss, that is, that he will be at fault in hitting someone else. Statistically it can be shown that most drivers pay a relatively low rate, as "good risks", and a relatively small group of "bad risk" drivers pay a high rate.

Under a pure no fault system, the rate will have to reflect the risk of sustaining loss, of being struck. Under the present system the worst risk of all possible risks is the 17 or 18 year old male, with no driver training, possessing his own car. He has an inordinately high risk of being to blame for a high speed collision, often with serious and fatal result. Under Senator Hart's approach he becomes a fairly good risk. If he becomes a fatality case, he has no dependents to claim lost support. If injured he will lose no wages. The chief risk is medical expense, and youth tends to heal fast without the lingering complications suffered by the older driver with arthritic joints.

The middle-aged hard working average family man is likely to be a good risk under present classification. Under no fault, he is not as good a risk. His recovery rate from injury is slower. If injured he is likely to demand the best medical attention, at high cost, and sustain near maximum monthly wage loss. Furthermore, his wife and children are apt to be in the car with him, and his company must consider this exposure. One authority in the field, Professor Braniard of the University of Rhode Island has calculated that about two-thirds of the drivers will pay more for no fault coverage and one-third will pay less. This projection has been borne out almost exactly under Manitoba's no fault systems, and the two-thirds whose cost went up were the heretofore good drivers.

I will leave it to you to conjure up a vision of the reaction in this country if the good drivers find that their rate has increased dramatically while the irresponsible driver, the drunken driver, gets a significant decrease in rates. The potential political effects and the effect on our industry's image are somewhat horrendous.

Limited no fault, of course, tends to ameliorate this problem because of the two or three thousand dollar maximum on first party benefits. The higher you raise these limits, the greater impact you have on the rate structure of the good driver.

After listening to all this discordant music, I am sure you must be asking what is the outlook for the future of automobile reparations. Insofar as the Congress is concerned, it is my judgment that we have a better than even chance of defeating Senator Hart's bill.

However, I think we will end up with Federal standards under which the Congress will propose minimum criteria for the states to follow with a grace period of two or three years for the states to act before Federal intervention. Republican members of the Senate who have opposed the Hart concept seem to be moving in that direction, and Senator Hart's supporters are giving some subtle signs that they might compromise on this approach. We would prefer no Federal interference of any kind, but many states are dragging their feet. The only hope to preserve state control of auto insurance, lies in swift and positive action in the 1972 legislatures to pass some form of first party benefits, and if they are going to keep costs from going up there must be some restrictions on tort liability and on general damages. If costs escalate, the public will react violently, and there will be considerable agitation for complete government take-over of the auto insurance business.

In that unpleasant truth, gentlemen, lies a message which comes through loud and clear. All of us must get off our apathy and become heavily involved. Our involvement must include our time as well as our financial resources.

On the degree of your involvement depends the final answer as to whether our way of doing business is to endure.

AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

THURSDAY, OCTOBER 14, 1971

**U.S. SENATE,
COMMITTEE ON COMMERCE,
Washington, D.C.**

The committee met, pursuant to recess, at 10:10 a.m., in room 5110, New Senate Office Building, Hon. Philip A. Hart, presiding.

Present: Senators Hart and Baker.

Senator HART. The committee will be in order.

Our first witness as we resume hearings on the redraft of S. 945 will be Mr. Charles Rue of New York. Mr. Rue appears as a spokesman for the Independent Mutual Insurance Agents Association.

STATEMENT OF CHARLES L. RUE, INDEPENDENT MUTUAL INSURANCE AGENTS ASSOCIATION; ACCOMPANIED BY IRVING B. MICKEY, DIRECTOR OF COMMUNICATIONS

Mr. RUE. Good morning, Senators. My name is Charles L. Rue, Jr. I am an independent insurance agent and a chartered property and casualty underwriter from Trenton, N.J. I am testifying today on behalf of the Independent Mutual Insurance Agents Associations of Connecticut, New Jersey, and New York State, which collectively represent 3,500 agencies and 10,000 individual agents in these three States and service approximately 5 million insured persons. I am currently chairman of our three-State national affairs committee.

Accompanying me is Mr. Irving B. Mickey, director of communications at our three-State headquarters in Glenmont, N.Y., and staff representative for both our national affairs and auto study committees.

I will not read all of the statement because quite a bit of it you have heard before.

Senator HART. It was good music then. I am sure it will be today as far as I am concerned. But let me order the statement printed in the record in full. As you proceed, if you wish to add to it, feel free to do so.

Mr. RUE. Our objective today is to reiterate our position that we previously related to you and again to extend our full support of the no-fault concept of accident reparations and to comment upon Committee Print No. 1 of July 1971.

We do not think the present system is working adequately. Conversely, our association, both individually and collectively strongly

supported the concept of first-party, no-fault systems because we are convinced that it will do the job that is not presently being done.

I would like to make these comments on the basic provisions of Committee Print No. 1.

Our comments last May on S. 945 were generally favorable, and we are highly gratified to note that its successor, Committee Print No. 1, either overcomes completely or minimizes most of the few serious objections which we raised toward the original document. Specifically:

1. It virtually eliminates the fault and tort concepts from automobile accident reparations, thereby assuring significant reduction of at least those costs associated with accident investigation and claims litigation.

2. Unlike the extremely narrow plans recently adopted by several States, it provides unlimited compensation for economic loss involving bodily injury and/or death, including the all-important but often-ignored factor of compensation for rehabilitation.

3. It places the automobile insurance much closer to a primary position relative to collateral coverages—and you may recall that this was our principal area of objection to the original S. 945. I will comment on that in just a bit.

4. It has eased, to a considerable degree, the severe restrictions on cancellation and nonrenewal which were established by S. 945. This, too, will be the subject of further comment.

These points, together with the other coverages provided for in Committee Print No. 1, add up to an extremely comprehensive reform measure. Such reservations as we have about the basic portion of the new bill center primarily on two areas.

1. Section 2(15), definition of "net economic loss," places the automobile insurance in a primary coverage position, except for: (a) any public health insurance plan; or (b) any private plan explicitly providing primary benefits under a qualifying no-fault policy.

While this represents a significant improvement over the wording of S. 945—and we are most grateful for this—we are still obligated to repeat our basic contention that automobile insurance should, in theory, pay all costs of automobile accidents and, therefore, should occupy a primary position over all collateral coverages. For a detailed explanation of this position, we again refer you to our testimony of May 14. All exceptions become artificial in the light of this fundamental truth, and any attempt to circumvent it can only result in shifting the economic burden of highway losses to other sectors of the economy.

2. Section 5(g)(1)(B) would permit policy cancellation or nonrenewal for two reasons only: failure to pay premium; or suspension or revocation of license. Both totally logical.

We suggest merely that there is one error of omission which should be given serious consideration—the chronic offender, who is involved in an abnormal number of accidents and creates disproportionately large losses for his insurance company.

Under an open rating system, such as we have in New York State, this is not an insurmountable problem—insurance companies can adjust rates in a manner commensurate with their losses. Under prior approval rating systems, however, where rates tend to be more sensi-

tive to political pressures, losses created by these chronic offenders could pose an unfair burden upon insurers.

As a solution to this problem, we repeat the suggestion which we offered last May: namely, that a statute of limitations of perhaps 3 to 5 years be placed upon these noncancellation and nonrenewal provisions, permitting the insurance company, at the conclusion of such period, to refuse further coverage of the risk upon presentation of reasonable evidence that the insured person is unworthy of such coverage or is in fact to all intents and purposes uninsurable.

Gentlemen, with these exceptions—and neither is decisive in our minds—we view the basic portions (sections 2 through 5, 8, and 9) of Committee Print No. 1 as a model first-party, no-fault accident reparations reform bill. We commend its authors for both their farsightedness and their courage. In the absence of positive, realistic reform action on the part of our respective States in a reasonable period of time—and let's face it, most of our States have been woefully delinquent in this regard—we would readily support the basic portions of this measure, provided that they were offered in the form of a standardized guidelines bill, leaving complete regulatory, implementation and enforcement authority in the hands of the States.

As to the question of State versus Federal control, unfortunately sections 6 and 7 of Committee Print No. 1 raise the same reservations on our part as did the comparable portions of S. 945. Specifically, they very clearly dictate certain critical implementation procedures which we believe should remain under State control.

This does not infer that the uniform statistical plan and the assigned claims plan are not meritorious in their intent; the reasoning behind them is completely sound.

However, both the actuarial operations and the data involved in the former; i.e., the uniform statistical plan, are already generally inherent in State ratemaking procedures, and the information contained in rate filings is a matter of public record.

Similarly—as we pointed out in cross-examination last May—the basic machinery for handling assigned claims already exists in the form of State automobile insurance or assigned risk plans. With relatively modest augmentation and additional expense, we are convinced that these existing facilities could be used to accomplish this mission.

Hence, we believe that Federal involvement in both of these areas is unnecessary from a practical standpoint and, therefore, represents unjustified infringement upon the prerogatives of State regulatory authorities. We simply cannot support these two sections.

For a more elaborate statement of our position with regard to State versus Federal jurisdiction over insurance, we refer you again to our testimony of May 14.

I would like to close our testimony this morning by explaining something which may have created some confusion in the minds of this committee. It has probably become apparent to you that our position on accident reparations reform differs somewhat from that adopted by our own national organization, the National Association of Mutual Insurance Agents. Specifically, we advocate a pure no-fault approach to the issue, while NAMIA supports a first-party payment system which retains fault and tort concepts and relies heavily upon arbitration machinery for its implementation.

To avoid any misinterpretation of our motives, we wish to make it abundantly clear that we do not in any way oppose the NAMIA position. Our ultimate objectives are identical—rapid, equitable compensation of accident victims—and both approaches, through their reliance upon first-party payments, achieve this goal.

We simply believe, at this stage of planning, that the pure no-fault approach, by eliminating the costs inherent in accident investigation and claims litigation, offers the most economical route to the desired goal.

If, however, the reform measures which ultimately evolve at either State or national level should take the form of the NAMIA plan or similar first-party systems, then we shall support that approach wholeheartedly and a reasonable evolutionary step toward our own no-fault objective.

Gentlemen, with the exception of these few areas of disagreement, we view Committee Print No. 1 as a masterpiece of reform legislation to which our own States might well pay heed. We wish you well with it, we hope that our suggestions will be taken under advisement, and if we can be of any further service, please feel free to call upon us.

We thank you for this opportunity to appear before you this morning.

Senator HART. Thank you, Mr. Rue. You have been helpful previously and you have again been helpful. It is my impression that as further—and we hope reasonably objective—attention is given to the study there will develop increasing support for the legislation to which you have addressed yourself and to which you have very clearly expressed some reservations while endorsing its major features.

May I ask if Mr. Mickey had anything he cared to add?

Mr. MICKEY. No, sir; I do not at this time.

Senator HART. Mr. Sutcliffe.

Mr. SUTCLIFFE. Mr. Rue, just a few questions. You discuss the present status of the primary-secondary issue in the committee print and suggest that there are two areas, namely, a public health plan or upon election of a private insurance plan, where automobile insurance can become secondary. How would you take into account the fact that some collateral benefits are provided to individuals in this country on a basis other than cash payout? In other words, there are fringe benefits in employment contracts and so forth. So if you make automobile primary, it is very difficult to avoid a duplication of payment. How do you do this without writing the contract so that it specifically makes one primary or secondary?

Mr. RUE. First of all, if you want to make that kind of division, in the circumstance to which you speak, and incidentally, automobile insurance may one day be a fringe benefit as well, that is a very real possibility, both are actuarially computed. A premium is paid for both coverages. So it would seem that duplication, if indeed it is, and oftentimes it is supplemental rather than duplication per se, is a matter of individual choice.

This is particularly true with the individual who carries his own personal hospitalization as well as his automobile insurance as well as other supplementary coverages. It seems to me if he elects to pay a premium for each of these coverages, then he should be entitled to recover in the event of a loss that touches any of these coverages.

Mr. SUTCLIFFE. It is not in the context of where he is paying a premium in the normal sense. Let me use a specific illustration. A person is a member of a labor union which has negotiated a contract providing for certain health care and wage replacement coverages. Nothing goes out of the union man's pocket to pay for that particular coverage. He is then placed under a mandatory first-party insurance plan by this bill. If the benefits of that fringe contract are to accrue to him, he would have to have some way to set off those benefits against his compulsory auto plan. Otherwise his fringe benefit is reduced when his union contract is given a secondary status to his auto insurance benefits in the automobile environment.

What I am asking you is:

How do you take account of that particular problem in a bill which you are trying to establish on a national basis and still give some consumers the benefit of something they have at this point in time?

Mr. RUE. Of course. No. 1, the automobile contract is limited to the automobile. Theoretically under the proposal we have here he should not need any collateral coverage beyond that which he would get as part of his automobile policy. It seems to me if that coverage is primary, as we believe it should be, it would not in the normal course of events affect his personal insurance.

Second, his personal or fringe benefit covers far more than just automobile per se; the individual accident nonautomobile and perhaps more important the sickness provisions.

Mr. SUTCLIFFE. You see no reason for giving that particular individual who has fringe benefits a cost break on his auto insurance mandatory policy?

Mr. RUE. No. I think his automobile insurance, as we have said repeatedly, should be primary. If, in fact, there is an adjustment, perhaps it should be on the other side of the coin.

Mr. SUTCLIFFE. You mentioned that the State regulatory authorities at the present time accumulate much of the information which the committee print would require the Secretary of the Department of Transportation or whatever other department to accumulate. What mechanism is there on a national basis for having the State regulatory authorities disseminate, for example, consumer cost information so that the consumer has the ability to shop for price when choosing his insurance carrier?

Mr. RUE. So far as I know, there is no present mechanism. The information is available. If one were curious enough, you could go to a State insurance department and see the actual filings.

Mr. SUTCLIFFE. Is this a rather complicated thing for the individual consumer to understand?

Mr. RUE. Yes, it is because he has to interpret what he is reading.

Mr. SUTCLIFFE. Could the insurance departments—could each of the insurance departments put it into a usable consumer form?

Mr. RUE. Yes, they have it all available. I think, if the uniform plan was established, then it could be a matter literally of filling in blanks to the amounts. I have great reservations personally concerning the value of publishing this information. Still, I am not so sure that people are going to be as interested as I think you may anticipate they are. The papers are full of a kind of information to come before the crisis. Many companies advertised the so-called low cost

Mr. SUTCLIFFE. Is the problem that the low cost is not necessarily an indication of the quality of the product? In other words, you need information as to both the quality of the insurance company as well as the price of the product that they are selling—quality measured in terms of claims payment?

Mr. RUE. It is very difficult to measure. I am sure he does assume that, if he is licensed to operate in a given State, it is in fact a quality company. The record shows that once in a while there are ones that are not of such great quality. Generally they are the ones that are selling their product at the lowest price: either they are trying to buy business and cannot make it or they are operating below the level that they should be for any given number of reasons.

I think there has to be and I think there will always be differences, simply because there are differences in companies and their modes of operation. Stock companies, if we can take the old cliches, that pay the stockholders, the mutual company that pays the policyholder, the so-called direct-writing companies who do not have to pay anybody—I do not think that is necessarily bad. People can find this out very readily. We get calls every single day of the week in our office from people who are doing more or less some shopping. They have gotten their renewal policy, the premium is up, it is more than they budgeted.

What do they do? They go to the yellow pages and they call the companies that they have seen advertised or whose ad sounds attractive to them. I have actually seen people who had quotations from 12 to 15 different sources. Then, after they had all this information, they really did not know what to do with it. They could not gage quality. They knew the XYZ company because they had seen the ad on the golf show on television. They knew the ABC company because they advertise regularly in the paper. What did they know? They only knew a name.

Mr. SUTCLIFFE. Is claims payment information a measure of quality to any extent?

Mr. RUE. It probably is, but I am not sure how it is gaged. There is all sorts of claim information available. We hear as agents as a feedback, because John Doe has a claim and he immediately tells all his friends down at the shop what happened, and he immediately gets all kinds of advice as to No. 1, what he should do, No. 2, what John Doe's company did, and how it should be handled.

He measures the performance that he receives from his insurance company based upon the hearsay, and it is only hearsay, of what he heard in the shop.

Now, if you get in there quick and settle the claim, you are great, you become a hero in the shop. If there is a problem, there is always somebody else either at work or in his association who has had the same experience but got better results. There is no real official claim experience available. It is purely a matter of hearsay, and often inaccurate, because no one wants to own up to the fact that he did not get enough in settlement. Even if they were shortchanged, they are not likely to admit it. So the information that is available is purely hearsay.

Mr. SUTCLIFFE. You mentioned potential for cost savings under the committee print. Yesterday we received testimony from certain insurance associations based upon actuarial studies that claimed cost increases. One of the assumptions that was made in those cost studies was

that there would be no reduction in acquisition cost. I recall at the last meeting you suggested that it would be possible, perhaps, to maintain the same margin of profit in your insurance agency operations by selling more units at lower cost because of the improvements or lowering of overhead under a first-party system. Is it realistic to expect that there would be cost savings in the acquisition cost area under a bill such as this without any determination of fault required?

Mr. RUE. That might depend on whose side you are on. But I will guarantee you that the first cost savings in the whole program will come in the acquisition cost. Historically, when there was a need for cost savings and a reduction in the expense factor, the agent's commission has been item A and subject 1 for consideration.

Mr. SUTCLIFFE. But this is something that the insurance associations have not been considering in their cost estimates; is that correct?

Mr. RUE. I do not know what they have been considering, frankly. I do not know their statistical base. But I can guarantee you that that will be the first thing that will happen. Of course, as you say, we did discuss this before, and I think it is entirely possible to operate on a lesser amount, again depending on what that lesser amount is, and still maintain a reasonable operational margin.

I think this kind of program is going to be helpful to my people and to my operation in terms of less time spent on claims problems. Seemingly, it has to be that way. If that is true, then I would be willing to talk about the acquisition cost. But it will be item A, I guarantee you.

Mr. SUTCLIFFE. That is all, Senator.

Senator HART. Thank you very much, gentlemen.

Mr. RUE. Thank you, sir.

(The statement follows:)

STATEMENT OF CHARLES L. RUE, NATIONAL AFFAIRS COMMITTEE, INDEPENDENT MUTUAL INSURANCE AGENTS ASSOCIATIONS OF NEW YORK, NEW JERSEY AND CONNECTICUT

INTRODUCTION

My name is Charles L. Rue. I am an independent insurance agent and a Chartered Property and Casualty Underwriter from Trenton, New Jersey. I am testifying today on behalf of the Independent Mutual Insurance Agents Associations of Connecticut, New Jersey and New York State, which, collectively, represent 3,500 agencies and 10,000 individual agents in these three states and service approximately 5,000,000 insured persons. I am currently Chairman of our three-state National Affairs Committee.

Accompanying me is Mr. Irving B. Mickey, Director of Communications at our three-state headquarters in Glenmont, New York, and staff representative for both our National Affairs and Auto Study Committees.

OBJECTIVES

The subject of first-party, no-fault automobile accident reparations is beginning to resemble the weather—everybody is talking about it, but, except for a few feeble experiments, nobody seems willing or able to do much about it.

Unlike the weather, however, if enough people keep talking about automobile accident reparations reform, somebody eventually is going to do something about it, because this is becoming virtually a public mandate.

And that's precisely why we're here today—to keep talking, in the hope that, each time we do, our arguments will fall upon a few more receptive ears and more credence will be given to people like yourselves, who see the shortcomings in our present reparations system and are earnestly attempting to rectify them.

More specifically, our objectives in testifying are to restate our full support of the no-fault concept of accident reparations and to comment upon Committee Print No. 1 of July, 1971.

BASIC POSITION ON FIRST PARTY REPARATIONS

Our basic position on accident reparations remains unchanged since our last appearance before this committee on May 14, 1971, and can be summarized as follows:

1. In our opinion, the present tort (or adversary) system of accident reparations is cumbersome, costly, painfully slow, leaves many relatively innocent accident victims uncompensated, clogs our court system, is predicated upon a factor (fault) which is frequently impossible to prove and, despite its theoretically punitive nature, has really done nothing to deter the chronic offender or reduce our burgeoning highway accident rate.

We can provide statistics galore to substantiate these charges and still others, but we won't take the time to do so, because you gentlemen have seen the same statistics. Simply stated, the system has proved itself completely out of step with present day needs and deserves the same fate as the dinosaur—extinction!

2. Conversely, our associations, both individually and collectively, *strongly* support the concept of a first-party, no-fault reparations system, because we are convinced that it will greatly speed claim settlements, lead to more equitable settlements for *all* accident victims, reduce at least those costs associated with claims investigation and litigation, and materially relieve court congestion. Needless to say, the first two of these—rapid, equitable claim settlements—outweigh all other considerations and should be the primary objectives of any reparations reform program.

For a more detailed discussion of these points, we refer you to our testimony of May 14.

COMMENTS ON BASIC PROVISIONS OF COMMITTEE PRINT NO. 1

As you may recall, our comments last May on Senate Bill 945 were generally favorable, and we are highly gratified to note that its successor, Committee Print No. 1, either overcomes completely or minimizes most of the few serious objections which we raised toward the original document. Specifically:

1. It virtually eliminates the fault and tort concepts from automobile accident reparations, thereby assuring significant reduction of at least those costs associated with accident investigation and claims litigation.

2. Unlike the extremely narrow plans recently adopted by several states, it provides unlimited compensation for economic loss involving bodily injury and/or death, including the all-important but often ignored factor of compensation for rehabilitation.

3. It places the automobile insurance much closer to a primary position relative to collateral coverages—and you may recall that this was our principal area of objection to the original Senate Bill 945. We shall comment further on this point in a moment.

4. It has eased, to a considerable degree, the severe restrictions on cancellation and non-renewal which were established by Senate Bill 945. This, too, will be the subject of further comment.

These points, together with the other coverages provided for in Committee Print No. 1, add up to an extremely comprehensive reform measure. Such reservations as we have about the basic portion of the new bill center primarily on two areas.

1. Section 2(15), definition of "net economic loss," places the automobile insurance in a primary coverage position, except for: (A) any public health insurance plan; or (B) any private plan explicitly providing primary benefits under a qualifying no-fault policy.

While this represents a significant improvement over the wording of Senate Bill 945—and we are most grateful for this—we are still obligated to repeat our basic contention that automobile insurance should, in theory, pay *all* costs of automobile accidents and, therefore, should occupy a *primary* position over *all* collateral coverages (for a detailed explanation of this position, we again refer you to our testimony of May 14). *All exceptions become artificial in the light of this fundamental truth, and any attempt to circum-*

vent it can only result in shifting the economic burden of highway losses to other sectors of the economy.

2. Section 5(g)(1)(B) would permit policy cancellation or non-renewal for two reasons only: failure to pay premium; or suspension or revocation of license. Both totally logical.

We suggest merely that there is one error of omission which should be given serious consideration—the chronic offender, who is involved in an abnormal number of accidents and creates disproportionately large losses for his insurance company.

Under an open rating system, such as we have in New York State, this is not an insurmountable problem—insurance companies can adjust rates in a manner commensurate with their losses. Under prior approval rating systems, however, where rates tend to be more sensitive to political pressures, losses created by these chronic offenders could pose an unfair burden upon insurers.

As a solution to this problem, we repeat the suggestion which we offered last May—namely, that a statute of limitations of perhaps three to five years be placed upon these non-cancellation and non-renewal provisions, permitting the insurance company, at the conclusion of such period, to refuse further coverage of the risk upon presentation of reasonable evidence that the insured person is unworthy of such coverage or is, in fact, to all intents and purposes uninsurable.

Gentlemen, with these exceptions—and neither is decisive in our minds—we view the basic portions (Sections 2 through 5, 8 and 9) of Committee Print No. 1 as a model first-party, no-fault accident reparations reform bill. We commend its authors for both their farsightedness and their courage. In the absence of positive, realistic reform action on the part of our respective states in a reasonable period of time—and let's face it, most of our states have been woefully delinquent in this regard—we would readily support the basic portions of this measure, provided they were offered in the form of a standardized guidelines bill, leaving complete regulatory, implementation and enforcement authority in the hands of the states.

STATE V. FEDERAL CONTROL

Unfortunately, Sections 6 and 7 of Committee Print No. 1 raise the same reservations on our part as did the comparable portions of Senate Bill 945. Specifically, they very clearly dictate certain critical implementing procedures which we believe should remain under state control.

This does *not* infer that the Uniform Statistical Plan and the Assigned Claims Plan are not meritorious in their intent—the reasoning behind them is completely sound.

However, both the actuarial operations and the data involved in the former (Uniform Statistical Plan) are already generally inherent in state rate-making procedures, and the information contained in rate filings is a matter of public record.

Similarly—as we pointed out in cross-examination last May—the basic machinery for handling assigned claims already exists in the form of state Automobile Insurance or Assigned Risk Plans. With relatively modest augmentation and additional expense, we are convinced that these existing facilities could be used to accomplish this mission.

Hence, we believe that federal involvement in both of these areas is unnecessary from a practical standpoint and, therefore, represents unjustified infringement upon the prerogatives of state regulatory authorities. We simply cannot support these two sections.

For a more elaborate statement of our position with regard to state versus federal jurisdiction over insurance, we refer you again to our testimony of May 14.

POSITION RELATIVE TO NAMIA

We want to close our testimony by explaining something which may have created some confusion in the minds of this committee. It has probably become apparent to you that our position on accident reparations reform differs somewhat from that adopted by our own national organization, the National Association of Mutual Insurance Agents. Specifically, we advocate a pure no fault approach to the issue, while NAMIA supports a first-party payment system which retains

the fault and tort concepts and relies heavily upon arbitration machinery for its implementation.

To avoid any misinterpretation of our motives, we wish to make it abundantly clear that we do *not*, in any way, oppose the NAMIA position. Our ultimate objectives are identical—rapid, equitable compensation of accident victims—and both approaches, through their reliance upon first-party payments, achieve this goal.

We simply believe, at this stage of planning, that the pure no-fault approach, by eliminating the costs inherent in accident investigation and claims litigation, offers the most economical route to the desired goal.

If, however, the reform measures which ultimately evolve at either state or national level take the form of the NAMIA plan or similar first-party systems, then we shall support that approach wholeheartedly as a reasonable evolutionary step toward our own no-fault objective.

Gentleman, with the exception of these few areas of disagreement, we view Committee Print No. 1 as a masterpiece of reform legislation to which our own states might well pay heed. We wish you well with it, we hope that our suggestions will be taken under advisement, and if we can be of any further service, please feel free to call upon us.

Senator HART. The committee welcomes again the vice president, government affairs, of the American Insurance Association, Mr. Melvin Stark.

STATEMENT OF MELVIN L. STARK, VICE PRESIDENT, GOVERNMENT AFFAIRS, AMERICAN INSURANCE ASSOCIATION; ACCOMPANIED BY LESLIE CHEEK, MANAGER, WASHINGTON OFFICE

Mr. STARK. Senator Hart, I have with me my associate, Mr. Leslie Cheek, who is the manager of our Washington office, and who will be my technical consultant.

Senator HART. I think this is the first time you have been here. You are welcome.

Mr. CHEEK. Yes, sir. Thank you.

Mr. STARK. We are pleased to have the opportunity to appear before you to speak to Committee Print No. 1 of S. 945.

We have attached to the statement submitted to you an appendix of three or four pages containing some cost information and some suggested technical amendments to the present version of the bill.

I won't get into that as part of my presentation, and I think perhaps the value of our appearance here might lie more in any questions you might ask.

I will abbreviate the statement, which in itself, is not too long.

Senator HART. In any event, it will be printed in the record.

Mr. STARK. Mr. Chairman and members of the committee. I am Melvin L. Stark, vice president, government affairs, of the American Insurance Association, whose membership of property and casualty insurance companies writes approximately one-third of the Nation's automobile insurance.

When he appeared before you to discuss the original S. 945 last May, our president, T. Lawrence Jones, said:

In our judgment, the great debate has ended. It can no longer be seriously contended that the auto tort liability system must be maintained. As we see it, the area of discussion has narrowed. There are two issues before us. One, *should we seek change through State or Federal action?* Two *how extensive should the change be to meet the pressing needs of the public?*

Our answers to these two questions remain unchanged. We continue to believe that auto accident reparations reform should be accomplished on a State-by-State basis, and that only a complete no-fault system will achieve the reform demanded by the American public. This past year we have diligently worked to accomplish these objectives.

It now seems clear and unmistakable that no-fault auto insurance is inevitable, that it will be enacted in one form or another by one body or another throughout the country.

Six months have now passed since the Nixon administration presented the conclusive findings of the Department of Transportation's two-and-a-half-year study of auto accident compensation systems, which established sound principles for no-fault reform. In so doing, the administration clearly advocated that reform be accomplished on a State-by-State basis.

That, too, has been the position of our association. But we must clearly admit surprise at both the number and variety of people and organizations who have been calling for reform by Federal legislation.

They have, in effect, been answering the Nixon administration's position of "let the States do the job," with the retort, "The States can't or won't, they are too dominated by opponents of reform, it will take too long," and the like.

At this point in time, our association must also confess disappointment in the legislative scorecard, the achievement of reform at the State level in the last 6 months. Some measures have been passed superimposing medical and wage loss benefits on the existing fault system, but with the exception of Florida, these cannot be called pieces of meaningful reform.

Massachusetts enacted a limited no-fault law in 1970, under which savings have exceeded the initial estimates of its sponsors and supporters.

If the States do not enact substantial no-fault reform bills, we believe they will substantiate the arguments of those who say that the States are not apt to act swiftly and decisively. We believe that the States want to design their own auto insurance laws. But they must show that they are willing to come to grips with the problem. Otherwise, as Secretary of Transportation, John Volpe puts it, "If they cannot or will not, Washington has a call for preemption."

All this could be chalked up to political or governmental infighting, if it were not for the fact that auto insurance reform touches so many millions of people in so many ways, and that it offers correction of recognized ills and satisfaction of public complaint.

As to the extent of reform, we continue to believe that only a complete no-fault system, replacing the current auto tort liability system in toto, will achieve maximum reform. Thus, we are in accord with the basic concepts underlying Committee Print No. 1 of S. 945. We can, and will, support at the State level legislation which closely follows the committee print subject to certain amendments we suggest in appendix A of this statement.

We would add further, that we would accept such a measure in terms of model legislation if it were passed by the Congress as standards or criteria for State action.

The staff analysis of the committee print, issued in July of this year, accurately states that the print would create an essentially restructured automobile insurance reparations system. Tort liability arising out of automobile accidents would be eliminated, and insurance benefits to pay for losses arising out of automobile accidents would be paid without regard to fault.

We vigorously endorse this alteration of the original S. 945, because it eliminates all vestiges of a system that spends one dollar of every three paid simply to determine which party to an auto accident is legally liable and whose insurance company should pay.

We would now like to address ourselves to an analysis of the no-fault program envisioned in Committee Print 1 of S. 945.

COST SAVINGS

While the original S. 945 would have resulted in some overall cost savings to automobile insurance consumers, the savings under Committee Print No. 1 would be considerable.

We estimate, on the basis of a cost study made in connection with our original no-fault auto insurance plan, that the average savings from premiums which would otherwise be considered adequate under the present system for bodily injury liability with limits of \$10,000/\$20,000 and uninsured motorist insurance would range from 25 to 30 percent.

Additional savings will be possible under the property damage portion of the committee print, but these will vary according to the deductible and the coverage modifications the insured chooses.

I might add that we have reinforced our comments with respect to the 25-30 percent range of savings in the exhibit attached to the statement, appendix A.

Taking loss costs under the present system as 100 percent, we have estimated the loss costs under the no-fault system as percentages of the existing system's loss costs. The general calculations for this estimate may be found in appendix A.

Now, I would like to address myself to pain and suffering. The committee print eliminates, for all but a tiny number of cases, intangible damages, or "pain and suffering," as a compensable loss under the basic no-fault auto insurance policy.

Recognizing, however, that some motorists may wish to place monetary values on dignitary harms incurred in automobile accidents, the print mandates the provision by insurers of optional, first-party contracts for pain and suffering. We endorse these changes with a single major reservation, and are prepared to offer our estimate of the cost of an optional first-party pain and suffering contract.

First, however, we would like to make some observations about "pain and suffering."

Opponents of no-fault auto insurance have rallied around this element of the current tort liability system, arguing, in effect, that while all other elements of loss can, and indeed should, be compensated on a first-party basis, "pain and suffering" should somehow be left to the adversary system.

We submit that there is no logical basis for this argument.

Opponents of no-fault allege that the elimination of "pain and suffering" will "reduce benefits" to auto accident victims. What benefits? Which accident victims?

According to the Department of Transportation study, table 13, page 41, 92.4 percent of all paid claimants under the tort system have no permanent injury at all. Their average economic loss is \$333, but their average tort recovery is \$830, almost $2\frac{1}{2}$ times their actual losses.

The elimination of "pain and suffering" in these cases would not "reduce benefits," but would take the profit element out of compensation of accident victims whose injuries are insignificant, or whose economic loss is slight.

It is well known today that pain and suffering awards are the major factor in the rising cost of auto insurance today. Auto insurance costs, in theory, should rise in direct proportion to increases in the costs of such things as medical and hospital care.

In fact, however, auto insurance costs rise geometrically, because, in the vast number of cases where economic loss is slight, it is almost always cheaper, despite the obvious waste, for an insurer to multiply the actual loss by a "pain and suffering factor" and pay the claim at up to eight times its actual value, rather than to contest it in the courts.

We are confident that not even the staunchest defenders of the current system would argue in favor of continuing this blatant misallocation of resources.

What about the seriously injured victims? First of all, again according to the DOT report, page 35, 55 percent of all those killed or seriously injured in auto accidents derive no benefit whatsoever from the tort liability system.

For the 45 percent who do benefit from the system, their recovery under it is inversely proportional to the severity of their losses. For example, when the economic losses alone exceed \$25,000, even successful tort claimants average a net recovery of only one-third of these losses. Recovery for pain and suffering is nonexistent in most of these cases, so eliminating it will in no way "reduce benefits."

The elimination of the wasteful and distorting element of "pain and suffering" under the basic no-fault system will make possible the compensation of all economic losses of all accident victims at reduced cost to the American motoring public.

We believe that the only "victims" of "reduced benefits" under the no-fault system proposed in the committee print are those crying loudest for the maintenance of "pain and suffering"—members of the bar who draw their fees from these awards.

In this connection, we would suggest that if the bar is sincere in its protestations that "pain and suffering" should be preserved for the sake of auto accident victims, rather than for the benefit of the legal profession, then it cannot oppose this legislation on this point. The committee print would make optional first-party pain and suffering contracts available to all motorists.

We have long believed that however real the pain experienced by auto accident victims may be, dollar values cannot be objectively assigned to it and dollar awards cannot ease it. But we are willing

to offer first-party contracts for pain and suffering that will provide for a scale of benefits above actual economic loss, either as a percentage of medical expenses or on the basis of fixed amounts for each type of injury.

We believe, however, that the demand for this coverage will be small; that there is no market for pain; and that few motorists will want to pay in advance for benefits for suffering they hope never to incur.

In our 1968 study, we recommended that a no-fault insurance system "provide extra payment to persons who sustain permanent impairment or disfigurement in automobile accidents to compensate them for such injuries which cannot be measured by economic loss."

We suggested that benefits vary according to the degree of impairment or disfigurement, but be limited to 50 percent of the amount payable to the claimant for his hospital and medical expense.

We estimated that this protection could be provided at a cost of 8.2 percent of the current premium charged for bodily injury insurance of \$10,000/\$20,000 and uninsured motorists coverage.

Obviously, if benefits under contracts of this sort were increased, or the scope of coverage was broadened to include the less seriously injured, the cost would increase greatly. The important point, however, is that contracts of this sort can be accurately priced by actuaries, and thus can be tailored to meet individual requirements.

Our reservations about the committee print's provisions in this area relate to the fact that section 2(17) defines "intangible damage" as being "measured by applicable State tort law which would have been applicable" but for the tort exemption in section 3.

To our mind, it is unsound to require companies to offer contracts in which their liability for pain and suffering is open ended, subject only to the vague standards of "applicable State tort law" and the whims of a jury. Contracts of this sort would be an open invitation to litigation and would preserve the evils that no-fault would otherwise eliminate.

We cannot overemphasize the importance in any first-party pain and suffering contract of making the insurer's liability explicit and easy recognizable by the insured.

EXTENT OF NO-FAULT BENEFITS

The scope of benefits provided under the basic no-fault policy has been greatly expanded in Committee Print No. 1, and we applaud virtually all of these additions. We offer some technical revisions in appendix A.

We particularly wish to endorse the expansion of S. 945 to include vehicular damage within the no-fault ambit of the bill. The elimination of the tort system in this important area of auto accident claims will result in significant savings, because it will no longer be necessary to investigate accidents to determine legal liability for vehicular damage.

Furthermore, insurers will be able to achieve a high degree of cost manageability and rating sophistication in connection with insured vehicles' design and repairability characteristics.

I would like to condense my statement in speaking of the ~~auto~~ insurance benefits as primary. I think the AIA has made its position clear as to having auto insurance primary. There are a variety of ~~other~~

Perhaps if the committee staff, or the Senator wishes to question us on it, we can go into it in detail.

I come now to the conclusion. Rejection and nonrenewal. We speak to this because that section of the proposal places severe prohibitions on insurers with respect to rejecting an applicant for insurance and the right not to renew a policy.

The only exceptions are where the domiciliary State insurance supervisory authority finds that the company's solvency would be impaired by writing additional policies, or where the company ceases to write all lines of business in a given jurisdiction. These exceptions are not available in the case of policy renewals.

These provisions might be acceptable if incompetent and reckless drivers were removed from the road, but in real life this does not happen. In our judgment, these provisions are far too severe, and should be eliminated. Under a no-fault auto insurance system, companies should be able to underwrite all risks without compulsion, because they will be able to measure the loss potential of each driver, an impossible task under the third-party liability system.

The industry recognizes its obligation to provide completely adequate coverage to all licensed motorists who cannot be readily insured in a voluntary market. But the rejection and nonrenewal provisions of S. 945 are not the way to assure that each licensed motorist will be afforded adequate insurance coverage.

POLICY FORMS, RATING CLASSIFICATIONS AND TERRITORIES, STATISTICAL PLANS

The committee print bestows on an unspecified "secretary" at the governmental executive level, enormous powers with respect to policy forms, classes of risks, and rating territories.

It also gives this secretary extensive control over the kinds of statistics companies can compile and requires insurers to submit detailed reports whenever the secretary calls for them.

Clearly, these provisions would be inappropriate if the bill were to be used as a model for State legislation. However, looking at the bill strictly as a Federal no-fault auto insurance reform measure, we believe these provisions should be eliminated, because they would subject insurance companies to both Federal and State regulation of policy forms, rating classifications, and territories and premium rates charged to policyholders.

From any standpoint, this confusing overlapping of regulatory authority is unsound.

This concludes our formal presentation, Mr. Chairman. We would be happy to answer the committee's questions.

Senator HART. Mr. Stark, thank you for repeating your support of the concept contained in this bill.

I would appreciate an exchange between you and Mr. Sutcliffe to develop more fully the element of cost and cost savings, but in your prepared remarks you emphasize, I think, something that is obscured when we get to thrashing around about cost.

The policyholder clearly is concerned about the cost, and if you stop him on the street and ask him what he thought about automobile insurance, that would be his first point of criticism and point for his openmindedness to another system.

But you remind us that as far as bodily injury cases are concerned, the real deficiency in the existing system is not so much the cost, as it is either the uncompensated or the disproportionately compensated victim of an accident.

When you look beyond the premium bill, here is where you see the really unsatisfactory aspect of the existing system. I need not repeat it, for you do it very well, and in very great scope here when you make the point that the thing is out of whack. The average economic loss runs \$333 for 92½ percent of all paid claimants under the tort system, none with permanent injury, with an average tort recovery of \$830, two and a half times actual losses.

As you put it later, that is a blatant misallocation of resources.

Second, before getting into the dollars and cents discussion, I think you speak a wise cautionary voice to all of those concerned about the Federal-State issue. You do counsel, not shyly, but soundly, that as time passes and legislative reform at the State level is either cosmetic or zero, that you buttress the argument of those who say that the States can't or won't, or that it will take too long.

I would offer for the record a letter that Larry Jones sent to the *New York Times* just a few days ago, commenting on a *Times* press report a few days before that which also I would suggest be added to the record, along with a similar press report from the *Long Island Press*.

In the letter to the *Times*, Mr. Jones is reaffirming your association's support of State reform, but cautions that that effort is being jeopardized by the kind of behavior that the press articles report occurring when a State legislative committee took to the field to hear testimony with respect to automobile insurance reform.

Too often our predictions are proved slightly wrong in the passage of time, but I am sure Mr. Jones' prediction is absolutely right, to wit, too much time continues to pass without genuine reform at the State level.

The demand for automobile insurance legislation at the Federal level will become overwhelming, and those who think it wrong will have only themselves to blame if in the passage of that time, they were in the position to persuade State action, but did not.

(The letter and press reports follow:)

AMERICAN INSURANCE ASSOCIATION,
New York, N.Y., September 28, 1971.

HON. PHILIP A. HART,
U.S. Senate,
Washington, D.C.

DEAR SENATOR HART: Enclosed you will find a copy of accounts in the *New York Times* and the *Long Island Press* of a hearing on no-fault auto insurance reform held earlier this month by the New York State Assembly Insurance Committee.

These accounts, supplemented by a first-hand report by one of our staff detailing hostile badgering by members of the Committee, prompted us to write the enclosed letter to the *Times*.

We thought that this development might be of interest to you.

Sincerely,

T. LAWRENCE JONES,
President.

Enclosure.

[From the Long Island Press, Sept. 9, 1971]

BAD DAY FOR NO FAULT INSURANCE

Advocates of no fault insurance were given a rough ride yesterday during a State Assembly Insurance Committee hearing on proposed changes in auto coverage laws.

Standing on their home turf at the Queens County Bar Association building, various lawyers issued expected attacks against no-fault. The asperity of the attacks combined with the sharpness of questioning by the assemblymen placed no-fault advocates on the defensive.

Bess Myerson, Commissioner of the New York City Department of Consumer Affairs, was all but chased from the podium when the committee realized her personal expertise in the field of insurance was very limited.

Standing tall and composed at the beginning of her speech calling for no-fault insurance, the former Miss America was later visibly shaken when told by one assemblyman to sit down "and let people who know what they are talking about—who have something to say—speak."

The committee's critical view of no-fault centered on its failure to provide for compensation for "pain and suffering."

No-fault insurance primarily eliminates the need to find one party in an accident to be "at fault" in order for compensation for injuries or damages to be paid. Under existing no-fault proposals, however, payments would be limited to medical and other costs, such as loss of income.

Kew Gardens Hills Assemblyman Emanuel Gold and others emphasized that a non-working individual, such as a retiree, would not be compensated for the discomfort and suffering resulting, for example, from loss of a limb.

Committee Chairman Alfred D. Lerner of Jamaica questioned the claim of no-fault supporters that such a plan would result in major premium reductions. He also said he disapproved of the loss of a person's right to sue the other party in an accident.

While Lerner placed this latter concern on the level of legal rights and established jurisprudence, other critics of no-fault seemed concerned over the loss of the right to punish the offending auto operator.

A special assistant to Gov. Rockefeller, Lewis Bart Stone of the State's Consumer Protection Board, said that because of the need for arguing "fault" more than 50 percent of auto insurance premiums are now used to cover administrative costs, compared to only 5 percent under no-fault systems such as Blue Cross.

Stone said that under the present system many accident victims are denied any compensation for losses. He said under no-fault, all injured would have out-of-pocket costs covered. He estimated that with the administrative cost savings, and the ending of payments for "pain and suffering," premiums would drop by an average of \$100.

Stone incurred the wrath of Seymour L. Colin, president of the State Trial Lawyers Association, by suggesting that "pain and suffering" payments were really payments to cover attorney fees. Colin termed Stone's remarks "offensive" and insisted lawyers were fighting no-fault in the interest of the public, and not to maintain lucrative negligence law practices.

Several lawyers suggested that control of insurance costs should center on automobile damages and coverage which used up the larger part of the insurance dollar.

A no-fault proposal supported by Rockefeller was criticized for provisions that would allow the auto coverage to remain untouched until an injured person has exhausted his personal medical insurance.

[From the New York Times, Sept. 22, 1971]

TO REFORM CAR INSURANCE

To the Editor: The accounts in The Times and other papers of the appearance by New York City Consumer Affairs Commissioner Bess Myerson on Sept. 8 before the New York State Assembly committee concerning no-fault auto insurance reform indicate shocking conduct on the part of some committee members.

As the city official chiefly responsible for consumer protection, Miss Myerson was attempting to bring to the members of the committee the point of view of knowledgeable, nonlegal consumers of insurance. Instead, some committee members sought highly legalistic information. The committee will have many opportunities to get such legal testimony because lawyers seem eager to appear and testify against reform of the auto insurance system.

Our association is in favor of state reform of the present costly and unfair auto insurance system. The opportunity to achieve reform at the state level is jeopardized, however, by conduct of state legislative committees such as that reported in connection with Miss Myerson's appearance. Such predisposed hostility toward consideration of auto insurance reform is fostering a growing feeling by members of the U.S. Congress that it is necessary for them to act if there is to be reform of the present slow, wasteful and expensive law-suit system.

T. LAWRENCE JONES.

President, American Insurance Association.

[From the New York Times, Sept. 9, 1971]

MISS MYERSON AND PANEL ON NO-FAULT INSURANCE CLASH

(By Robert J. Cole)

Bess Myerson, the city's Consumer Affairs Commissioner, came out strongly yesterday, for no-fault auto insurance and immediately found herself under repeated attack from members of a legislative committee who considered her ill-prepared to answer questions on the subject.

The Commissioner attempted to read a prepared statement before an Assembly hearing called to consider legislation on no-fault insurance but she was interrupted repeatedly for clarification. On each occasion, she turned to her general counsel, Susan J. First, for assistance.

At one point, Assemblyman Alfred D. Lerner, Republican of Queens and chairman of the committee, gestured to Miss First to stand back, saying: "I want to get Miss Myerson's testimony. I don't think we need an alter ego."

At another point, following a series of arguments over complicated legal questions, Miss Myerson asserted that "legislators are a little prehistoric and medieval when it comes to consumer legislation."

CHIDED BY ASSEMBLYMAN

Assemblyman Joseph R. Pisanì, a New Rochelle Republican, shouted back to Miss Myerson: "I've listened patiently to your diatribe. . . . If you don't have any informed statements to make, thank you for your time, and let's hear from someone who does."

The legislative panel, composed of four lawyers and two businessmen, is considering a number of plans to reimburse victims of auto accidents without regard to fault.

The New York State Bar Association is proposing a measure to enable accident victims to recover up to \$1,500 of economic losses, but to retain the right to sue for other damages. A more comprehensive measure—the so-called Stewart plan, named for Richard E. Stewart, former State Insurance Superintendent—would provide for payment of all economic losses but prohibit suits for pain and suffering.

FURTHER FRICTION ARISES

Attempting to end her testimony on a positive note, Miss Myerson said that she didn't feel that legislation under consideration had to be "either, or," as she put it. She said she felt that "some kind of compromise can be reached."

Mr. Lerner then asked if she would remain "to hear some other testimony." Just Miss Myerson went into an outer lobby to confer with Assemblyman Benjamin Gold, Democrat-Liberal of Queens.

"Would you see if Miss Myerson would care to remain," Mr. Lerner asked. "She doesn't appear to be interested in learning anything from us," Mr. Lerner replied. "Let's proceed."

Miss Myerson returned to the hearings, conducted at the Queens County Bar Association at 90-35 148th Street, Jamaica, and sat in the audience for nearly 20 minutes before leaving.

"She wasn't prepared," Mr. Lerner said later.

Governor Rockefeller's special assistant on consumer questions, Lewis H. Stone, charged that "it would be better to consider pain and suffering as a measure of the pain and suffering of lawyers, rather than that of accident victims."

Senator HART. Mr. Sutcliffe?

Mr. SUTCLIFFE. Mr. Stark, to pursue the cost problem somewhat because of conflicting testimony received by this committee, what is the cost of the present system if you look beyond acquisition cost to the policyholder and consider such things as the Department of Transportation's report that seriously injured automobile accident victims go uncompensated to the tune of \$2.5 billion per year?

Is that a cost of the present system, though it is not an acquisition cost problem?

Mr. STARK. It is a cost.

Mr. SUTCLIFFE. Is that ever calculated in any actuarial figures?

Mr. STARK. I can't say for sure.

I think the projections that have been made of the cost of paying all victims of automobile accidents must take into consideration the fact that under the present system some are uncompensated, some are undercompensated, as the Senator said, and I think that must be part of an actuarial projection, if I understand your question.

Mr. SUTCLIFFE. I think my question goes more toward calculations of either cost savings, or cost additions.

Do they take into account costs of the present system outside the acquisition cost area?

In other words, when they say that it will cost as much as it cost yesterday said, 37.5 percent more money than the present system, does the calculation of the present system include outside the present system that go uncompensated or underpaid?

Mr. STARK. I don't know, but I am sure that I have not heard of that projection, and I don't think it would be fair to include it in it at this point.

Mr. SUTCLIFFE. I am projecting that if you want to pay for acquisition cost, you are going to have to pay for the cost of the present system, 10 and 20 percent more. I am assuming that the present system would be 37.5 percent more than the present system.

Mr. STARK. I am not sure that I have heard of that projection.

We have not heard of that projection.

Mr. SUTCLIFFE. I am projecting that if you want to pay for acquisition cost, you are going to have to pay for the cost of the present system, 10 and 20 percent more. I am assuming that the present system would be 37.5 percent more than the present system.

In other words, if you want to pay for acquisition cost, you are going to have to pay for the cost of the present system, 10 and 20 percent more.

Mr. STARK. The answer to both of your questions is, yes.

Mr. SUTCLIFFE. So, in cost projections, we have to consider both acquisition cost and cost to the society not necessarily reflected in the price of the product?

Mr. STARK. That is correct.

Mr. SUTCLIFFE. Let me turn, then, to your cost projections so that perhaps we can understand in less technical terms, the calculations of those costs.

In appendix A you list the percentage of loss cost. Can you please describe for the committee what loss costs include?

Does this include pure premium loss as well as loss adjustment expense?

Mr. STARK. Yes. The economic losses we have set forth here include the medical, hospitalization, rehabilitation expense, income loss, and other expenses.

Then we have listed some loss-reducing factors.

If I understand you correctly, you are asking me whether or not the loss cost includes loss and loss expense?

Mr. SUTCLIFFE. Yes.

Mr. STARK. Yes.

Mr. SUTCLIFFE. They include both of those?

Mr. STARK. Yes.

Mr. SUTCLIFFE. In effect, you are not saying of the present loss, medical, hospital, and rehabilitation expenses will be 37.9 percent of that loss.

The present loss cost—I am trying to develop some comparability between these figures and figures that were presented to us yesterday, which were based upon percentages of pure loss rather than loss plus adjustment expense because they came out with 149 percent of the present pure loss as opposed to here an 18.1 percent of what you establish as loss cost.

Mr. STARK. Can I ask Mr. Cheek to field that? He had the advantage of being here yesterday, and he prepared the actual statistics.

Mr. CHEEK. I did have a chance to read carefully the actuarial studies that were submitted by the other two trade associations, and as they quite honestly point out, this is an area in which a lot of rather large assumptions must be made.

Comparing the total no-fault system to a third party liability system is really like comparing apples to oranges. There are frictional costs within the existing system, and, as you pointed out earlier, societal costs under the existing system by virtue of the fact that a large number of injured people are a burden to society as a whole, rather than to the tort liability system, that must be taken into account on some basis.

My feeling about the other two studies is that they are projecting medical expenses, for example, on the basis of the current levels of cost increases in medical services.

It is our belief, particularly in light of the President's economic program, that these factors will no longer continue to rise at the same rate that they are currently rising.

Mr. SUTCLIFFE. Let me stop you at that point.

Does the payment for rehabilitation have a depressing effect upon medical expense experienced in the liability area?

Mr. CHEEK. It certainly does. Under the liability system there is almost a counterincentive to rehabilitation, and to the extent that you delay it, you almost invariably increase its ultimate cost.

Under a first party system, you can proceed to rehabilitation immediately and lower its ultimate cost to the system.

Mr. SUTCLIFFE. Excuse me, I did not mean to interrupt.

Mr. CHEEK. Now, on the wage loss side, they are assuming. I would have to say, that there are going to be a lot of horrible hypotheticals. We don't believe this is the case.

If I could just cite one company's experience, that of the Aetna Life & Casualty, which has, for a number of years, administered the Federal Employees Health & Benefits Association. They found in culling their claims records for a period of 6 years in a program insuring 2-plus million Federal employees, that there were only 16 cases in which the claims exceeded \$50,000 and this is in medical.

But the point is that when your medical expenses reach that stage, obviously, your income loss is going to be of a comparable, if not greater, severity.

My point is that the number of cases that will constitute what are called big hits in the insurance business is a tiny fraction of the total number of cases, and that the reductions you achieve in not overcompensating the less seriously injured persons more than offset the provisions in this committee print for more lavish income loss benefits to those that are disabled for a substantial amount of time.

Mr. SUTCLIFFE. Let me put it in simple terms, and see if you can give me a simple answer.

People ask how can you significantly expand benefits which Committee Print No. 1 does and not at the same time, significantly expand acquisition cost?

Mr. CHEEK. Acquisition cost?

Mr. SUTCLIFFE. Premium.

Mr. CHEEK. I understand you.

Mr. SUTCLIFFE. Because I want to draw the distinction at all times between costs of the system and acquisition cost or premium cost.

Mr. CHEEK. I have got you.

The answer to that question is in the statistic that we put in our statement from the DOT report, which is 92.4 percent of the paid accident victims sustain no permanent injury, no serious economic loss of any sort.

That is a very large number of people, and they are being overpaid by a factor ranging from 2½ in some cases, to 4½ times in other cases.

To the extent that you eliminate the profit factor, the overpayment factor in the vast number of accident cases that have minor injuries and minor wage loss, you free up an enormous amount of money to pay the economic losses of those seriously injured victims who are now recovering very little even of their economic loss.

Mr. STARK. May I add to that?

There are two other areas of savings, which I will mention for the record.

Legal fees—we pay lots of money to our own defense lawyers, and an additional expense that goes into the field of claims investigation——

Mr. SUTCLIFFE. Let me stop you there.

Senator HART. Wait a second.

What was that?

Mr. STARK. Claims administration and investigation.

Mr. SUTCLIFFE. You mentioned the legal fees you paid your defense attorneys.

What about the legal fees paid to the plaintiff? Is that money now available instead of paying for the plaintiff's attorney—available for benefit payments?

Mr. STARK. Obviously, because the statistics as to what we pay include not just a net recovery of a representative victim, but gross payments paid in his behalf, which includes whatever the attorney fee is that he is going to pay his lawyer, which averages out to somewhere around 35 percent, according to the DOT study.

Mr. SUTCLIFFE. You mentioned another area; claims?

Mr. STARK. Claims expense administration.

That is an internal cost that we have to sustain for the purpose of investigating causation to find out who is responsible.

Mr. SUTCLIFFE. Under the committee print the only thing you would have to be investigating is the extent of injury.

Mr. STARK. Extent of injury. The whole investigation narrows down to the nature and extent of injury.

Mr. SUTCLIFFE. Are there examples of other insurance mechanisms that undertake this same kind of investigation?

Mr. STARK. I think the most dramatic one is workmen's compensation. There, to all intents and purposes, the factual investigation is rather small, but the area of investigation that we go through and the costs involved in the nature and extent of injury for the purpose of arriving at a settlement or an award, is relatively large.

Mr. SUTCLIFFE. Another thing that puzzles me on your appendix submission is your offsets for collateral sources under the committee print.

You have credited here 0.2 percent of the present cost of the system as an offset for collateral sources.

How is this going under the primary-secondary issue, to have an impact?

Mr. STARK. This, I think, if I understand your question, relates to what is available in terms of benefit payments to auto injured victims by contracts other than automobile insurance.

Mr. SUTCLIFFE. Here, this is collateral sources.

Mr. STARK. So, it would be governmental plans and private plans.

Mr. SUTCLIFFE. So, if this is based upon Committee Print No. 1, we haven't really disturbed very much—the primary-secondary issue—if it is only 0.2 percent of the total cost?

Mr. STARK. Let me get back for a moment. You asked me a question before about an example of causation versus the medical, and I spoke of workmen's compensation.

An obvious example is the present accident health system, where payment is paid without regard to causation. You have an injury, and you are paid.

Mr. CHEEK. As for the figure to which you referred on collateral sources, remember, we assumed that auto benefits would be primary to all other sources of recovery, with the exception of social security as it is now constituted.

Mr. SUTCLIFFE. On what basis did you make that assumption?

Mr. CHEEK. In our study of the personal injury files, we calculated the availability of social security benefits as an element in the compensation that those victims received, and it came out to that percentage of the total loss.

Mr. SUTCLIFFE. You did not project what the collateral source exceptions in Committee Print No. 1 would end up giving?

Mr. CHEEK. No; I did not. That would vary tremendously.

Our sole feeling there is that if you make auto secondary to virtually all other sources of compensation, you waste some of your administrative savings.

In other words, if rating were confined to the basic things like salary, size of family, and so forth, rather than on what other coverages are available to the man, rating becomes an extremely simple proposition.

But, if you have to, as your bill would make us, calculate a different rate for each person on the basis of his other coverages, that consumes an enormous amount of time and a great deal of expense.

There is also the question of whether that coverage will be there when the loss occurs.

In other words, if an insured promises you that he will have such and such amount of medical payments before your liability attaches, your rate presumes that that is going to, in fact, happen.

If it does not, what happens ultimately is that the rate for the auto insurance will have to go up.

Mr. STARK. The point is that the logic of the situation is inevitable, in our minds. If you are going to have a compulsory mandatory automobile insurance system, that in itself calls for the fact that that should be primary, because if you have that primary, then you know you have got to pay when the losses are incurred there.

As to other sources of the kind that Mr. Cheek was referring to, collateral sources other than governmental—they are not compulsory to a great extent. Some group coverages may or may not provide the necessary protection. They may be very short.

This bill calls for unlimited payment of medical, rehabilitation, and hospital cost.

I am quite sure there are no group plans of that character available in this country. The fact that this is a plan that has much wider scope, much wider applicability, providing a system for 108 or 110 million automobiles and the members of families and others who are in those cars. It seems to me we make a case for making automobile insurance primary and all other private sources definitely secondary.

Mr. SUTCLIFFE. Of course, the committee print calls for standardized deductions to take into account the possible cost of calculating each individual's secondary sources to the penny.

So, if you had five categories, it would entitle a person to one of five levels of deduction, and his particular collateral sources that were made primary to the auto would make them fit into those five notches?

Mr. STARK. We are not sure he is going to have them all the time during the course of the policy.

We know he has to carry automobile insurance, but is he necessarily 365 days of the year going to carry faithfully all those coverages on

the basis of which we have given him a discount on the first day of the policy?

We have no way of enforcing it. We have a great administrative problem here.

Mr. SUTCLIFFE. The enforcement problem is the most crucial.

Mr. STARK. The hodgepodge—would involve unnecessary hanky-panky. We would have to get statements from people, affidavits, we would have to investigate every case to find out for sure whether the man was still carrying that coverage.

There could be a breach of warranty. There would have to be a readjustment of the premium if there was a violation of his initial promise.

These things, I feel, really frustrate the essential rationale.

Mr. SUTCLIFFE. Are your policyholders really that sly?

Mr. STARK. Some of them are, yes.

Senator HART. Senator Baker.

Senator BAKER. Thank you, Mr. Chairman. I have no questions.

Senator HART. We were reminded of this concern yesterday and repeatedly it was called to our attention. Oversimplified a little, it goes this way: what you are doing by moving to a no-fault system is removing one's feeling of responsibility to operate a vehicle. The drunk drives into the bridge abutment and you see what you have done. I think nobody has pushed the argument to the extreme of saying that the drunk wouldn't have hit the bridge if you hadn't had no-fault, but there are other areas where it is suggested that no-fault simply increases the irresponsible use of vehicles on highways.

How do you respond to that?

Mr. STARK. You have tossed me a soft ball. I am going to try to knock it out of the park.

I try to answer this so frequently, Senator, in terms of some of the original arguments that were made to this whole issue, that somehow a no-fault proposal for automobile insurance diminishes ethics, moral responsibility, and the devotion to careful driving.

That argument is not only false, it is illusory, it does not stand up under scrutiny.

Senator BAKER. Why is it false? I would like to hear just an elaboration of that point if you would.

Mr. STARK. If the system of tort law were operating today in terms of automobile accidents where the individual who would cause the accident—let's assume the classical application—paid the victim for damages under civil law, I think we have a fair test of that. But the fact of the matter is that the insurance mechanism has by itself frustrated this whole approach.

The insurance mechanism offers itself as a vehicle, as a buffer, as an insulator between the injured person and the one who may cause the injury by saying you pay us a premium and we will take your premium and we will put it into a common fund. Now, out of that fund we are going to pay people for their injuries, assuming legal liability.

I think we all know by this time that classical negligence law is no longer in existence in practically any jurisdiction in this country. The whole impact of the law, trial, appellate, otherwise, whether before a judge or a jury, has been, in the case of automobile accidents, to broaden the base of those compensated for being hurt.

The idea of one suing and then being told he can't collect because of contributory negligence is a fast-vanishing aspect of the law.

What we do in effect is those very minute number of cases that actually do go to suit and trial, is to balance the equities. The jury is doing it, the judge is doing it, and only in that rare number in the spectrum of black and white cases where you can definitely show that there is clear liability, clear nonliability, do we have the situation of classical law operating.

Where somebody is sitting in a car and it is legally parked, and that car is struck by another vehicle, that is unmistakable. Those cases are disposed of. But, today, with the insulating mechanism that exists with this enormous insurance fund paying off and people making it eminently clear that they want to be paid, they do not want all these legalisms, they do not want all this rigamarole, they do not want to go through trouble in order to collect.

I think what we have tried to do is to gage the public mood, and I think a logical case can be made for the fact that, in terms of its present situation, there is no deterring effect as far as the fault system is concerned, on the conduct of the driver.

Our representation is that the careful driver today under the fault system is going to be a careful driver under the no-fault system, and the miserable driver under a no-fault system is going to be the same under a fault system.

The point we make is that the burden of acting as the enforcer or the preventor or the inhibitor of automobile accidents should not rest on the insurance mechanism. It rests on public authority.

To the extent the government in different jurisdictions has a relatively different, relatively stronger or weaker approach to dealing with those who cause accidents and violate the law, that is the way to deal with the problem of conduct on the highways. But we do not think there is any deterrence at all in a system, either a fault system or a non-fault system; we do not think that a no-fault system would increase accidents or cause a higher degree of driver misbehavior.

Senator BAKER. If the chairman will indulge me for just a moment I would like to pursue this a little bit further. Might it be said that your argument can be equally sustained by outlawing insurance?

Mr. STARK. Sure, you could have a government operated fund.

Senator BAKER. Can you tell me approximately how many drivers of automobiles in the country are insured for liability?

Mr. STARK. We think, Senator, it is in the neighborhood of 80 to 85 percent, but I would say no more than 85 percent.

Senator BAKER. Are there figures available on that point?

Mr. STARK. They are in the DOT study.

Senator BAKER. Tell me what they are.

Mr. SUTCLIFFE. The estimate is 15- to 20-percent uninsured motorists nationwide.

Mr. CHEEK. Senator, on that same point, the three States that have made liability insurance compulsory have had no better experience as to the degree to which people carry liability insurance than those States which have not made it compulsory.

The percentages of uninsured motorists are about the same in the States whether it is compulsory or noncompulsory.

Senator BAKER. What about the accident figures?

the basis of which we have given him a discount on the first day of the policy?

We have no way of enforcing it. We have a great administrative problem here.

Mr. SUTCLIFFE. The enforcement problem is the most crucial.

Mr. STARK. The hodgepodge—would involve unnecessary hanky-panky. We would have to get statements from people, affidavits, we would have to investigate every case to find out for sure whether the man was still carrying that coverage.

There could be a breach of warranty. There would have to be a readjustment of the premium if there was a violation of his initial promise.

These things, I feel, really frustrate the essential rationale.

Mr. SUTCLIFFE. Are your policyholders really that sly?

Mr. STARK. Some of them are, yes.

Senator HART. Senator Baker.

Senator BAKER. Thank you, Mr. Chairman. I have no questions.

Senator HART. We were reminded of this concern yesterday and repeatedly it was called to our attention. Oversimplified a little, it goes this way: what you are doing by moving to a no-fault system is removing one's feeling of responsibility to operate a vehicle. The drunk drives into the bridge abutment and you see what you have done. I think nobody has pushed the argument to the extreme of saying that the drunk wouldn't have hit the bridge if you hadn't had no-fault, but there are other areas where it is suggested that no-fault simply increases the irresponsible use of vehicles on highways.

How do you respond to that?

Mr. STARK. You have tossed me a soft ball. I am going to try to knock it out of the park.

I try to answer this so frequently, Senator, in terms of some of the original arguments that were made to this whole issue, that somehow a no-fault proposal for automobile insurance diminishes ethics, moral responsibility, and the devotion to careful driving.

That argument is not only false, it is illusory, it does not stand up under scrutiny.

Senator BAKER. Why is it false? I would like to hear just an elaboration of that point if you would.

Mr. STARK. If the system of tort law were operating today in terms of automobile accidents where the individual who would cause the accident—let's assume the classical application—paid the victim for damages under civil law, I think we have a fair test of that. But the fact of the matter is that the insurance mechanism has by itself frustrated this whole approach.

The insurance mechanism offers itself as a vehicle, as a buffer, as an insulator between the injured person and the one who may cause the injury by saying you pay us a premium and we will take care of you and we will put it into a common fund. Now, out of that fund we are going to pay people for their injuries, assuming that the system is working.

I think we all know by this time that classical tort law is no longer in existence in practically any jurisdiction. The whole impact of the law, trial, appellate, or otherwise, judge or a jury, has been, in the case of no-fault, to broaden the base of those compensated for injuries.

The idea of one suing and then being told he can't collect because of contributory negligence is a fast-vanishing aspect of the law.

What we do in effect is those very minute number of cases that actually do go to suit and trial, is to balance the equities. The jury is doing it, the judge is doing it, and only in that rare number in the spectrum of black and white cases where you can definitely show that there is clear liability, clear nonliability, do we have the situation of classical law operating.

Where somebody is sitting in a car and it is legally parked, and that car is struck by another vehicle, that is unmistakable. Those cases are disposed of. But, today, with the insulating mechanism that exists with this enormous insurance fund paying off and people making it eminently clear that they want to be paid, they do not want all these legalisms, they do not want all this rigamarole, they do not want to go through trouble in order to collect.

I think what we have tried to do is to gage the public mood, and I think a logical case can be made for the fact that, in terms of its present situation, there is no deterring effect as far as the fault system is concerned, on the conduct of the driver.

Our representation is that the careful driver today under the fault system is going to be a careful driver under the no-fault system, and the miserable driver under a no-fault system is going to be the same under a fault system.

The point we make is that the burden of acting as the enforcer or the preventor or the inhibitor of automobile accidents should not rest on the insurance mechanism. It rests on public authority.

To the extent the government in different jurisdictions has a relatively different, relatively stronger or weaker approach to dealing with those who cause accidents and violate the law, that is the way to deal with the problem of conduct on the highways. But we do not think there is any deterrence at all in a system, either a fault system or a non-fault system; we do not think that a no-fault system would increase accidents or cause a higher degree of driver misbehavior.

Senator BAKER. If the chairman will indulge me for just a moment I would like to pursue this a little bit further. Might it be said that your argument can be equally sustained by outlawing insurance?

Mr. STARK. Sure, you could have a government operated fund.

Senator BAKER. Can you tell me approximately how many drivers of automobiles in the country are insured for liability?

Mr. STARK. We think, Senator, in the neighborhood of 80 to 85 percent, but I would say no more than 85 percent.

Senator BAKER. Are figures available on that point?

Mr. STARK. That is the best I can do.

Senator BAKER. What is the percentage of uninsured motorists?

Mr. STARK. Approximately 15 percent uninsured motorists nationwide.

Mr. STARK. In the States that have compulsory liability insurance, the three States that have made no provision for compulsory liability insurance have had no better experience as to the percentage of uninsured motorists than those States that have made provision for compulsory liability insurance.

Mr. STARK. Are the figures about the same in the States that have compulsory liability insurance as in the States that do not have compulsory liability insurance?

Mr. CHEEK. That doesn't seem to vary with the amount of insurance available. I would say that is more a matter of the number of cars.

Mr. STARK. The question does have special adaptability to Massachusetts where accident frequency had been remarkably high.

Senator BAKER. Do you find any correlation in your judgment between those factors?

Mr. STARK. No, not necessarily.

Mr. CHEEK. As far as claims frequency is concerned, there is a correlation, but as far as accident frequency is concerned, I don't see how any case can be made.

Senator BAKER. Explain that a little further.

Mr. CHEEK. To the extent that plaintiffs in Massachusetts were assured that at least the bodily injury liability coverage was available, presumably if it was another Massachusetts driver involved in the accident, the incentive to bring a claim was certainly higher.

What happened in Massachusetts was that because only the BI liability was compulsory, you had a good many cases of what came to be known as "the Massachusetts back," where a driver who had sustained no personal injury whatsoever would bring a claim for his vehicle damage against the other party alleging that there was bodily injury involved, and as a result the claim frequency in Massachusetts under BI was approximately double the national average.

Senator BAKER. Do you see that as a correlation to compulsory insurance?

Mr. STARK. No.

Mr. CHEEK. Not really.

Senator BAKER. What is it a correlation to?

Mr. STARK. If I may pick up, I think in terms of Massachusetts, the situation was rather unique, and they moved away from it by virtue of the enactment of the modified No-fault statute, which incidentally has shown a rather stunning reversal of both accident frequency and claim frequency.

Incidentally, those statistics are being compiled on the first 6 months of operations, and they will be out very shortly from Massachusetts for analysis.

Senator BAKER. What would be your evaluation of the situation where a person didn't or was unable to purchase insurance under the No-fault system? What is the equity of that situation?

Mr. STARK. Let me try to describe it this way: presently, except for these three States that require compulsory insurance, Massachusetts, New York, and North Carolina, practically every other State, I believe, has financial responsibility laws which are, in effect, one-bite laws. So, the law says that you must carry insurance for the benefit of a third party. That is the whole basis for it.

The motivation for carrying that has been rather suspect for a long time, because both in the compulsory States and in the financial responsibility States at any given time there is always a percentage of people that just do not carry automobile insurance. That does not necessarily mean they cannot afford it. They do not carry it.

Even when they are required to carry it, they are willing to take the chance of a revoked or suspended license.

Under a No-fault system, we think there is a greater motivation. This is a judgmental decision on our part. We have no facts to sustain it.

We are saying we are going to write a policy for you and your automobile, we are going to pay claims to you, your family, and the occupants of your car, friends or relatives, and that an occasional pedestrian is also included that you might strike.

There is no motivation to make a person buy automobile insurance to protect that random unknown third party that neither he nor we can ever identify. The compulsion to buy under the no-fault system is here, you have got to buy it, and it is compulsory, this is what our plan calls for, what this bill calls for, but if you do not buy it, you are not hurting some random third party, some fellow you might have a collision with. You are hurting yourself, your family, the occupants of your car, the pedestrian you may strike. This is very personal now.

So, if you do not buy it, you are hurting yourself, you are hurting your own pocketbook, you are putting yourself on the line for possible financial obligation or loss of earnings to which you may not have any other way to go for collection.

We think there are some logical arguments for assuming that this will cause more people to buy insurance than presently buy insurance.

Senator BAKER. It would cause more people to buy insurance, but how do you defend against the charge that the price you pay for compelling more people to buy insurance is to remove by statute the chance that someone has to collect through the negligence of someone else when he could not afford to buy insurance for himself?

Mr. STARK. That is a long chance, but, after all, it is only a percentage of the people who collect that. The DOT statistics indicate that only 45 percent of the people who are seriously hurt even collect anything.

Senator BAKER. But the figures do not impress me. Even if there was just one person who was injured for life and had a traditional tort claim for hundreds of thousands of dollars, for instance, a young man with a family and good earnings, if he did not buy no-fault insurance it is his fault and the blame lies with him. This is still unfortunate. But it seems to me that the price we are paying for no-fault is high if this young man did not buy insurance or could not afford to buy insurance and someone in the most wanton and negligent way ran him down. We would have made him totally incapable of seeking any remuneration at all.

Even if there is just one such person in the country, we have made him pay a terrible price for no-fault.

Mr. STARK. Senator, I do not think there is any possible plan or way of approaching this that will solve each and every situation. Our particular program does call for an assigned claims plan for individuals who might otherwise be entitled to benefits, but because of lack of insurance would have no policy to go to.

Our program calls for a fund that the licensed insurers in any State would have to contribute to that would pay the victims of these accidents. That would exclude the individual who was a driver or the owner of the car who saw fit not to buy the automobile insurance.

Senator BAKER. Would your program include the negligence, would it include him, if the driver of the car involved in the accident was nonnegligent?

Mr. STARK. No, he would have no claim for negligence, I come back again to the point I made previously, not only are there only 45 percent

of those seriously hurt that you have hypothesized who do not collect, but let us take the other 55 percent. Again I have got to go back to statistics, because our own study and also the DOT study shows that here in this area where there is this greatest concern for whether or not the fault system or the no-fault system is a proper apparatus for compensation, in that area of greatest concern is the greatest failing of the fault system. Those it does pay are under compensated seriously, relatively, and absolutely. They are under compensated for several reasons. One, the great majority of automobile insurance policies are written at a modest liability limit, 15/30, let's assume is the median—let's take 25/50, where the individual would have the right to get a maximum of \$25,000. Twenty-five thousand dollars for the hypothetical case is a pittance. That is all you are going to get.

Senator BAKER. Isn't that a commentary on the inadequacy of the system rather than the imperfection of it? Couldn't you meet the objection you have just now raised in this context by going to a European plan of unlimited coverage?

Mr. STARK. Oh, yes. We would be glad to sell unlimited coverage if people would pay the premium.

Senator BAKER. They pay it in Europe. Do you have any idea how that would affect your reserve requirements?

Mr. STARK. I think the problem essentially is that it would be difficult to compare our situation with the European situation. The economic situation here in the United States, the degree of sophistication—

Senator BAKER. Would you be willing to give me an estimate on those differences?

Mr. STARK. No, I do not think I could give you that.

Senator BAKER. Could you later?

Mr. STARK. I might. I will try.

Senator BAKER. Would you try? And I ask unanimous consent that this response be included in the record.

What I want is to have an estimate of what additional cost in premiums to people in the United States would be involved in providing a system of unlimited liability. I am thinking of systems similar to those used in Germany, England and other parts of the world.

Back on the question of this small statistical sample of people who do not or cannot buy no-fault insurance but who get clobbered; there are some and, as I said, if there is one, there is cause for concern.

Can you give me some estimate of how many people would fall in that category based on our present insurance coverages? You obviously cannot transpose liability insurance into no-fault insurance, but your estimate is that 15 to 20 percent of the drivers in the country are not now covered?

Mr. STARK. That is correct.

Senator BAKER. In your judgment, would that be a comparable figure to the experience we might have with no-fault?

Mr. STARK. For the purposes of analogy, yes, subject to the fact that it is our conception that there would be an increase in the number of people who would buy it. I think the area would be narrowed down to 10 percent.

Senator BAKER. There are how many drivers in the United States?

Mr. STARK. About 105 million, I believe.

Senator BAKER. So there would be about 10.5 million people who in fact you could run down without any responsibility?

Mr. STARK. These are only drivers you are talking about, not the potential injured?

Senator BAKER. How many would the potential injured be? Can we average 2.5 people to three to a driver?

Mr. STARK. I believe the latest statistic we have between bodily injuries was somewhere between 4.5 and 5 million.

Senator BAKER. I am trying to identify those that would have no remedy.

Mr. STARK. The driver.

Senator BAKER. What about the passengers in his car?

Mr. STARK. The assigned claims plan would pick up the passengers who were not responsible.

Senator BAKER. Is there an assigned claims plan in Committee Print No. 1?

Mr. SUTCLIFFE. Yes, sir.

Senator BAKER. The 10.5 million drivers then would not be covered under any circumstances in the no-fault plan.

Mr. STARK. Who did not purchase.

Senator BAKER. That is your estimate of the number, it would be about 10 percent?

Mr. STARK. Yes.

Senator BAKER. But the passengers in their cars would be covered?

Mr. STARK. Yes, under the assigned claims plan. Then we would have to narrow down the 10.5 million exposure to the likely fraction of that number who would be sustaining an injury during the course of the year. That you could do by relating the 5 million figure I gave you previously to the 200 million American population, which is what, 4 percent, am I right? So, it would be 4 percent of the 10.5 million, or less than 500,000 persons.

Senator BAKER. That is a pretty good size group who are unable to pay.

Mr. STARK. That is a lot of people.

Mr. SUTCLIFFE. There is something that may mitigate against that, and that is the Department of Transportation is undertaking a system of uniform motor vehicle registration which would make it much easier to tie your insurance, licensing, and your registration procedures into the requirement for insurance and also through visual detection of the vehicle itself. You may be able to cut the number not purchasing mandatory insurance significantly.

I think the example is the voluntary activities of the American people in the payment of income tax which is a federally mandated requirement, compare that to the European system of the voluntary payment of income tax and you have disparity.

Mr. STARK. As a supplement, Senator Baker, if I may reply to your comment, I would like to add for the completion of the record that under the present fault system I suspect there is much more than that number of drivers who are hurt and who are not insured who are cast on society because they have been unable to collect for injuries.

Senator BAKER. I do not doubt that. But the thing that bothers me is that we by Federal statute are preparing to extinguish the rights

of theoretical possibility of recovery as distinguished from the unsuccessful effort to recover or the failure to try.

I am sure that someone has long since deprived us of any concern for the constitutional consequences of depriving 10.5 million people life, liberty, and property, and I expect this probably is due process of law, but it is still a heavy burden for 10.5 million people to pay, and there is one whale of a difference between a man who does not recover versus a man who says you are helpless and you cannot recover under any circumstances.

That bothers me.

Mr. STARK. If there is a way to make this bill adapt itself to that kind of a vacuum, we would be very interested in trying to see what can be done about it.

Senator BAKER. It is important for me to understand you agree that this omission does occur and it is not covered under the no-fault plan.

Mr. STARK. Yes. But it does not make the no-fault plan a worse plan than the fault system.

Senator BAKER. I have not reached that judgment yet, and I am not prepared to say I will. But I am prepared to say at this time that that is a defect that ranks at least with the other defects that have been noted to the fault system.

Mr. STARK. Perhaps.

Senator BAKER. Thank you, sir.

Senator HART. I am reminded that we do have a witness schedule this morning. We would suggest if there are further questions, if there would be no objection, we could address them to you in writing and your replies may be made in writing.

Mr. STARK. Thank you, gentlemen. We would be very happy to reply.

(The statement and questions and answers follow:)

STATEMENT OF THE AMERICAN INSURANCE ASSOCIATION

Mr. Chairman and Members of the Committee: I am Melvin L. Stark, Vice President-Government Affairs of the American Insurance Association, whose membership of property and casualty insurance companies writes approximately one-third of the nation's automobile insurance. We appreciate this opportunity to express our views on Committee Print No. 1 of S. 945, the National No-Fault Motor Vehicle Insurance Act.

In our judgment, the great debate has ended. It can no longer be seriously contended that the auto tort liability system must be maintained. As we see it, the area of discussion has narrowed. There are two issues before us.

One, should we seek change through state or federal action? Two, how extensive should the change be to meet the pressing needs of the public?

Our answers to these two questions remain unchanged. We continue to believe that auto accident reparations reform should be accomplished on a state by state basis, and that only a complete no-fault system will achieve the reform demanded by the American public. This past year we have diligently worked to accomplish these objectives.

It now seems clear and unmistakable that no-fault auto insurance is inevitable, that it will be enacted in one form or another by one body or another throughout the country. Six months have now passed since the Nixon Administration presented the conclusive findings of the Department of Transportation's two-and-a-half-year study of auto accident compensation systems, which established sound principles for no-fault reform. In so doing, the Administration clearly advocated that reform be accomplished on a state-by-state basis.

That, too, has been the position of our Association. But we must clearly admit surprise at both the number and variety of people and organizations who have been calling for reform by federal legislation. They have, in effect, been answer-

ing the Nixon Administration's position of "let the states do the job," with the retort, "the states can't or won't, they are too dominated by opponents of reform, it will take too long," and the like.

Our Association also must confess to disappointment in the legislative scorecard, the achievement of reform at the state level in the last six months. Some measures have been passed superimposing medical and wage loss benefits on the existing fault system, but with the exception of Florida these cannot be called pieces of meaningful reform. Massachusetts enacted a limited no-fault law in 1970, under which savings have exceeded the initial estimates of its sponsors and supporters.

If the states do not enact substantial no-fault reform bills, we believe they will substantiate the arguments of those who say that the states are not apt to act swiftly and decisively. We believe that the states want to design their own auto insurance laws. But they must show that they are willing to come to grips with the problem. Otherwise, as Secretary of Transportation John Volpe puts it, "If they cannot or will not, Washington has a call for pre-emption."

All this could be chalked up to political or governmental in-fighting, if it were not for the fact that auto insurance reform touches so many millions of people in so many ways and that it offers correction of recognized ills and satisfaction of public complaint.

As to the extent of reform, we still believe that only a complete no-fault system, replacing the current auto tort liability system *in toto*, will achieve maximum reform. Thus, we are in accord with the basic concepts underlying Committee Print No. 1 of S. 945. We can, and will, support at the state level legislation which closely follows the Committee Print subject to certain amendments we suggest in Appendix A of this statement.

The staff analysis of the Committee Print, issued in July of this year, accurately states that the Print "would create an essentially restructured automobile insurance reparations system. Tort liability arising out of automobile accidents would be eliminated, and insurance benefits to pay for losses arising out of automobile accidents would be paid without regard to fault." We vigorously endorse this alteration of the original S. 945, because it eliminates all vestiges of a system that spends one dollar of every three paid simply to determine which party to an auto accident is legally liable and whose insurance company should pay.

We would now like to address ourselves to an analysis of the no-fault program envisioned in Committee Print No. 1 of S. 945.

COST SAVINGS

While the original S. 945 would have resulted in some overall cost savings to automobile insurance consumers, the savings under Committee Print No. 1 would be considerable. We estimate, on the basis of a cost study made in connection with the American Insurance Association's no-fault auto insurance plan, that the average savings from premiums which would otherwise be considered adequate under the present system for bodily injury liability with limits of \$10,000/\$20,000 and uninsured motorist insurance would range from 25 to 30 percent. Additional savings will be possible under the property damage portion of the Committee Print, but these will vary according to the deductible and the coverage modifications the insured chooses.

Obviously, greater savings will accrue to those consumers who now carry bodily injury liability limits in excess of \$10,000/\$20,000, and to those persons whose wage levels are below the \$1,000 per month maximum. Savings will vary for individual insureds from the overall range above depending upon the economic characteristics of the family unit.

Taking loss costs under the present system as 100 percent, we have estimated the loss costs under the no-fault system as percentages of the existing system's loss costs. The general calculations for this estimate may be found in Appendix A.

PAIN AND SUFFERING

The Committee Print eliminates, for all but a tiny number of cases, intangible damages, or "pain and suffering," as a compensable loss under the basic no-fault auto insurance policy. Recognizing, however, that some motorists may wish to place monetary values on dignitary harms incurred in automobile accidents, the Print mandates the provision by insurers of optional, first-party contracts for pain and suffering. We endorse these changes with a single major res-

ervation, and are prepared to offer our estimate of the cost of an optional first-party pain and suffering contract.

First, however, we would like to make some observations about "pain and suffering." Opponents of no-fault auto insurance have rallied around this element of the current tort liability system, arguing, in effect, that while all other elements of loss can, and indeed should, be compensated on a first-party basis, "pain and suffering" should somehow be left to the adversary system. We submit that there is no logical basis for this argument.

Opponents of no-fault allege that the elimination of "pain and suffering" will "reduce benefits" to auto accident victims. What benefits? Which accident victims? According to the Department of Transportation study (Table 13, p. 41), 92.4 percent of all paid claimants under the tort system have no permanent injury at all. Their average economic loss is \$333, but their average tort recovery is \$830, almost 2½ times their actual losses. The elimination of "pain and suffering" in these cases would not "reduce benefits," but would take the profit element out of compensation of accident victims whose injuries are insignificant or whose economic loss is slight.

It is well known that pain and suffering awards are the major factor in the rising cost of auto insurance today. Auto insurance costs, in theory, should rise in direct proportion to increases in the costs of such things as medical and hospital care. In fact, however, auto insurance costs rise geometrically, because in the vast number of cases where economic loss is slight, it is almost always cheaper, despite the obvious waste, for an insurer to multiply the actual loss by a "pain and suffering factor" and pay the claim at up to 8 times its actual value than to contest it in the courts. We are confident that not even the staunchest defenders of the current system would argue in favor of continuing this blatant misallocation of resources.

What about the seriously injured victims? First of all, again according to the DOT report (p. 35), 55 percent of all those killed or seriously injured in auto accidents derive no benefit whatsoever from the tort liability system. For the 45 percent who do benefit from the system, their recovery under it is inversely proportional to the severity of their losses. For example, when the economic losses alone exceed \$25,000, even successful tort claimants average a net recovery of only one-third of these losses (p. 36). Recovery for pain and suffering is non-existent in most of these cases, so eliminating it will in no way "reduce benefits."

The elimination of the wasteful and distorting element of "pain and suffering" under the basic no-fault system will make possible the compensation of all economic losses of all accident victims at reduced cost to the American motoring public.

We believe that the only "victims" of "reduced benefits" under the no-fault system proposed in the Committee Print are those crying loudest for the maintenance of "paid and suffering"—members of the bar who draw their fees from these awards. In this connection, we would suggest that if the bar is sincere in its protestations that "pain and suffering" should be preserved for the sake of auto accident victims, rather than for the benefit of the legal profession, then it cannot oppose this legislation on this point. The Committee Print would make optional first-party pain and suffering contracts available to all motorists.

We have long believed that however real the pain experienced by auto accident victims may be, dollar values cannot be objectively assigned to it and dollar awards cannot ease it. But we are willing to offer first-party contracts for pain and suffering that will provide for a scale of benefits above actual economic loss, either as a percentage of medical expenses or on the basis of fixed amounts for each type of injury. We believe, however, that the demand for this coverage will be small; that there is no market for pain; and that few motorists will want to pay in advance for benefits for suffering they hope never to incur.

In our 1968 study, we recommended that a no-fault insurance system "provide extra payment to persons who sustain permanent impairment or disfigurement in automobile accidents to compensate them for such injuries which cannot be measured by economic loss." We suggested that benefits vary according to degree of impairment or disfigurement, but be limited to 50 percent of the amount payable to the claimant for his hospital and medical expenses.

We estimated that this protection could be provided at a cost of \$2.25 percent of the current premium charged for bodily injury insurance of \$100,000 and uninsured motorist coverage.

Obviously, if benefits under contracts of this sort were increased, or the scope of coverage was broadened to include the less seriously injured, the cost would increase greatly. The important point, however, is that contracts of this sort can be accurately priced by actuaries, and can thus be tailored to meet individual requirements.

Our reservations about the Committee Print's provisions in this area relate to the fact that Section 2(17) defines "intangible damage" as being "measured by applicable State tort law which would have been applicable" but for the tort exemption in Section 3. It is unsound to require companies to offer contracts in which their liability for pain and suffering is open-ended, subject only to the vague standards of "applicable state tort law" and the whims of a jury. Contracts of this sort would be an open invitation to litigation and would preserve the evils that no-fault would otherwise eliminate.

We cannot overemphasize the importance in any first-party pain and suffering contract of making the insurer's liability explicit and easily recognizable by the insured.

EXTENT OF NO-FAULT BENEFITS

The scope of benefits provided under the basic no-fault policy has been greatly expanded in Committee Print No. 1, and we applaud virtually all of these additions. We offer some technical revisions in Appendix A.

We particularly wish to endorse the expansion of S. 945 to include vehicular damage within the no-fault ambit of the bill. The elimination of the tort system in this important area of auto accident claims will result in significant savings, because it will no longer be necessary to investigate accidents to determine legal liability for vehicular damage. Furthermore, insurers will be able to achieve a high degree of cost manageability and rating sophistication in connection with insured vehicles' design and repairability.

AUTO INSURANCE BENEFITS PRIMARY

Under Committee Print No. 1, net economic loss benefits are secondary to other sources which state that they are primary to the auto policy. We think this is unsound for both economic and public policy reasons, and that compulsory auto insurance benefits ought to be primary to all other benefit sources except the present Social Security System.

From an economic standpoint, if auto insurance benefits are primary, the administrative work of the insurer will be limited to the simple determination that an auto accident has occurred and the subsequent payment of benefits. If auto insurance benefits are secondary to other coverage, the insurer will be forced to make a time-consuming and costly investigation of other benefits available to each injured person in order to avoid duplicate payment for the same loss.

Furthermore, shifting the administrative costs of processing bodily injury claims to accident and health or hospitalization insurers will not result in any appreciable savings to motorists. Since any accident causing significant injury will undoubtedly be accompanied by considerable property damage, the auto insurer will be required to investigate the accident anyway to assess the extent of such damage. It makes little economic sense to require multiple investigations of the same accident by several insurers, when under a primary auto insurance system, a single investigation will assure payment of all benefits from a single source.

Making no-fault automobile insurance primary will greatly simplify the process of classifying motorists for rating purposes, in that rates for drivers with similar exposures will not have to vary according to the amount of other insurance available to them. The elimination of such random variables will facilitate the adoption of a broad classification system, which in turn will lower premium costs by spreading losses over the large numbers in each class.

It should be noted that the variations in auto insurance prices which will result from making collateral sources primary will serve to frustrate the potential of a primary no-fault auto insurance system to reverse the existing pattern of auto insurance costs, in which those least able to afford it frequently pay the highest premiums. If collateral sources are primary, the affluent driver secure in a job with good fringe benefits will continue to pay less for his auto insurance than the center city dweller whose employment typically has less tenure and fewer fringe benefits.

From a public policy standpoint, the internalization of automobile accident costs to the auto insurance system will serve several essential goals.

First, it will prevent the shifting of economic losses generated by the nation's motoring populace onto the nation's population as a whole. The non-motoring public should not be required to pay for auto accident losses in the form of higher premiums for their hospitalization and medical insurance or higher taxes.

Second, the statistical separation of auto accident losses from other kinds of losses, which a primary auto insurance system will assure, will demonstrate the cost of automobile transportation relative to the costs of alternative modes of transportation. The public interest in the rational allocation of transportation resources will be ill-served if a portion of the true cost of motoring is hidden from scrutiny, as it would be if the auto insurance system were secondary.

Finally, it should be remembered that the placing of collateral sources before auto insurance benefits may, in many instances, inadvertently exhaust the limits provided under the other systems for losses resulting from causes other than automobile accidents and produce severe hardships for auto accident victims who later suffer non-auto related injury or disability.

REJECTION AND NON-RENEWAL

The Committee Print places severe prohibitions on insurers with respect to rejecting an applicant for insurance and the right not to renew a policy. The only exceptions are where the domiciliary state insurance supervisory authority finds that the company's solvency would be impaired by writing additional policies, or where the company ceases to write *all* lines of business in a given jurisdiction. These exceptions are not available in the case of policy renewals.

These provisions might be acceptable if incompetent and reckless drivers were removed from the road, but in real life this does not happen. In our judgment, these provisions are far too severe and should be eliminated. Under a no-fault auto insurance system, companies should be able to underwrite all risks without compulsion, because they will be able to measure the loss potential of each driver, an impossible task under the third-party liability system.

The industry recognizes its obligation to provide completely adequate coverage to all licensed motorists who cannot be readily insured in a voluntary market. But the rejection and non-renewal provisions of S. 945 are not the way to assure that each licensed motorist will be afforded adequate insurance coverage.

POLICY FORMS, RATING CLASSIFICATIONS AND TERRITORIES, STATISTICAL PLANS

The Committee Print bestows on an unspecified "Secretary" enormous powers with respect to policy forms, classes of risks and rating territories. It also gives this Secretary extensive control over the kinds of statistics companies can compile and requires insurers to submit detailed reports whenever the Secretary calls for them.

Clearly, these provisions would be inappropriate if the bill were to be used as a model for state legislation. However, looking at the bill strictly as a federal no-fault auto insurance reform measure, we believe these provisions should be eliminated, because they would subject insurance companies to both federal and state regulation of policy forms, rating classifications and territories and premium rates charged to policyholders. From any standpoint, this confusing overlapping of regulatory authority is unsound.

This concludes our formal presentation, Mr. Chairman. We would be happy to answer the Committee's questions.

Respectfully submitted,

MELVIN L. STARK,
Vice President—Government Affairs.

APPENDIX A—COST SAVINGS

The calculations underlying our estimate of cost savings under a total no-fault auto insurance system, expressed in terms of percentages of loss costs under the existing bodily injury liability insurance coverage, are as follows:

Economic Losses:

| | |
|--|------|
| Medical, hospital and rehabilitation expenses..... | 37.9 |
| Income loss..... | 36.3 |
| Other expenses..... | 6.9 |
| Total of economic losses..... | 81.1 |

Reductions in these loss costs and their amounts, again in percentage terms, are as follows:

| | |
|---|-----|
| Medical expense reductions: Medicare----- | 1.5 |
| Medicare ----- | 1.5 |
| Income loss reductions: | |
| 15 percent deductible----- | 4.0 |
| \$1,000 per month recovery limit----- | .9 |
| Collateral sources----- | .2 |
| Total of all reductions----- | 6.6 |

Subtracting the reductions from the gross economic losses, we found that the basic total no-fault system for compensating injured auto accident victims would cost, on the average, 74.5 percent of the current loss costs for \$10,000/\$20,000 bodily injury liability and uninsured motorist protection. Expressed in terms of premium, the average saving would be approximately 27 percent.

Following is a list of those sections of Committee Print No. 1 of S. 945 that the American Insurance Association believes need clarification or amendment, or, in some cases, deletion.

SECTION 2—DEFINITIONS

The term "insurer" includes any "governmental entity" engaged in the business issuing or delivering motor vehicle insurance policies. We believe that this portion of the definition should be deleted. Unless the Congress decides that a federal entity is needed to sell any of the no-fault coverages mandated in the bill, at which point separate enabling legislation would have to be enacted, reference in this legislation to such a government-operated insurer is unnecessary.

"Criminal conduct" is defined as "the commission of an offense punishable by imprisonment for one year or more, or operation or use of a motor vehicle with the specific intent of causing injury or damage, or operation or use of a motor vehicle as a converter without a good faith belief that the operator or user is legally entitled to operate or use such vehicle." This definition is the key to the residual right to bring tort actions under Committee Print No. 1. However, the definition does not make clear the kind of proof of "criminal conduct" which will be necessary to subject a person to liability for tort damages. We believe that the definition should be amended by inserting the words "the conviction for" before the words "the commission of * * *." Without this addition, it is possible that the mere assertion by one party that another was "engaging in criminal conduct" will be sufficient to sustain a tort action.

The "substantially the same or similar" test for "gainful activity" in the original S. 945 has been altered to read "available and appropriate" in Committee Print No. 1. We believe that the language of the original S. 945 should be reinstated. The new standard is vague and subjective, and raises the question of whether benefits will become payable merely upon a claimant's assertion that work of the kind he wants is either not "available" or not "appropriate" in his view.

That portion of the definition of "economic loss" which provides for monthly benefits equalling the difference between a person's earnings prior to an accident and those after the accident does not take into account the possibility that a job with lower pay might be taken by a claimant as a matter of personal preference, rather than out of physical necessity. We believe the definition should be tightened to make benefits under this subsection payable only upon proof that the lower-paying job is directly related to the automobile accident injury.

The portion of the definition of "economic loss" dealing with household replacement services and other benefits includes provisions for funeral expenses with no apparent dollar limit. We believe that such a limit should be included in this subsection. We recommend a limit of \$1,000.

The Committee Print's definition of "monthly earnings" does not contain the subsection of the original S. 945 describing how annual earnings are to be computed. Instead, the Committee Print contains provisions authorizing "the Secretary" to promulgate rules defining the term "monthly earnings." We believe that the language from the original S. 945 should be reinstated.

While we applaud the concept incorporated in the Committee Print's definition of "monthly earnings" of anticipated earnings benefits for unemployed or irregularly employed accident victims, we are concerned that the provisions as drafted in the Committee Print will inject an element of speculation and sub-

jectivity into the provisions of the basic no-fault automobile insurance contract, and will be certain to invite extensive litigation. We recommend that this portion of the definition of "monthly earnings" be amended to provide that anticipated compensation benefits be calculated according to average wage statistics prepared by the Department of Labor's Bureau of Labor Statistics. We assume, of course, that anticipated earnings benefits are subject to the bill's upper limits on salary loss of \$1,000 per month.

The definition of "monthly earnings" also contains a subsection for built-in cost-of-living increases in monthly wage loss payments and other periodic increases to reflect "annual compensation increases that would predictably result but for the injury or death." This subsection should be amended to specify that it is subject to the \$1,000 per month ceiling on wage loss replacement.

The definition of "net economic loss" incorporates the proposition that no-fault automobile insurance benefits should be secondary to "any public health insurance or plan," but primary to "any private insurance or plan" which contains no "explicit provisions making its benefits primary to any benefits" under the no-fault auto policy. We believe that the no-fault automobile insurance benefits should be primary to all health insurance or other plans, except the present Social Security system.

The definition of "loss resulting from damage to the insured's motor vehicle" contains provisions for benefits "including expenses incurred in renting a vehicle in substitution for the insured motor vehicle." We believe that the words "of comparable value" should be inserted before the words "in substitution for * * *" in the rental benefits provision, in order to prevent abuses.

SECTION 3—TORT EXEMPTION

Section 3 of Committee Print No. 1 ties the tort exemption to "criminal conduct," providing essentially that no owner, operator, or user of an insured motor vehicle will be liable in tort "unless that person is engaging in criminal conduct." Here again, we would suggest that the test for tort liability be made conviction for engaging in criminal conduct, rather than merely "engaging" in such conduct.

This Section raises other important questions as well. First, it appears that the owners or operators of uninsured vehicles will remain liable for tort damages. We do not believe that this provision is necessary, in view of Section 4's provisions for fines of up to \$1,000 or imprisonment for a period of up to six months for "any knowing violations" of the operation and registration conditions of the bill. Second, the remainder of the bill does not make it clear whether tort liability incurred as a result of "engaging in criminal conduct" is insurable. Rather, the Section suggests the intent to create a "tort fine" for "engaging in criminal conduct." If indeed this is the intent of the legislation, we believe that it should be specified.

SECTION 5—INSURANCE REQUIREMENTS

The provisions requiring insurers to offer optional pain and suffering contracts do not specify how much "intangible damage" benefits will be payable, or on what basis they will be paid. We recommend that these benefits be paid according to the terms and conditions of the pain and suffering contract, rather than by reference to "applicable state tort law." Otherwise, insurers' liability under these contracts will be theoretically unlimited, and a great deal of unnecessary litigation will be interjected into the auto accident reparations system.

We object strongly to the subsection requiring that "any policy of insurance * * * must offer standardized categories of premium reductions reflecting the benefits available * * * as a result of public or private insurance or plan or other benefit sources * * *, being primary to benefits under a qualified no-fault policy." First, as we have indicated above, we believe that no-fault auto insurance benefits should be primary to all other benefit sources. In addition, the variety of benefits available under contracts offered by private accident and health insurers today is almost unlimited. It would be extremely difficult for auto insurers to ascertain precisely what benefits were available to prospective auto policyholders in order to apply the "standardized categories of premium reductions." In addition, the bill contains no provisions whatever to assure automobile insurers that the collateral sources for which auto premium reductions are offered will be in force at the time of an auto-related injury. At the very least, if it is the will of the Committee to retain this subsection, auto insurers should be freed from liability for losses the insured had indicated upon application for his automobile insurance policy would be paid by other benefit sources.

We also object to Section 5's provisions restricting insurers' ability to reject applicants or cancel no-fault policies. We believe that the Committee should explore alternative means of assuring qualified applicants of a readily available market for the compulsory no-fault coverages.

SECTION 10—ADMINISTRATION

This Section of the Committee Print leaves the references to the Administrative Procedure Act in the original S. 945's provisions for promulgation of regulations by the Secretary. The new section provides that the Secretary shall "make, promulgate, amend, and repeal such regulations as he deems necessary." We believe that the references to the Administrative Procedure Act should be reinstated, in order to assure that all parties at interest are given an opportunity to participate in the promulgation of rules and regulations under the Act.

U.S. SENATE,
COMMITTEE ON COMMERCE,
Washington, D.C., November 15, 1971.

Hon. WARREN G. MAGNUSON,
Chairman, Committee on Commerce, U.S. Senate,
Washington, D.C.

DEAR MR. CHAIRMAN: I am forwarding a copy of a letter I received from Mr. Melvin L. Stark of the American Insurance Association in response to two questions I submitted as a followup on testimony received at our recent hearings. I ask that this additional information be included in the record of those hearings. The attached document mentioned in the letter has been retained for my files. I will be happy to make it available to the Committee.

Thank you very much.
Yours truly,

HOWARD H. BAKER, Jr.

Enclosure.

AMERICAN INSURANCE ASSOCIATION,
Washington, D.C., November 8, 1971.

Hon. HOWARD H. BAKER, Jr.,
U.S. Senate, New Senate Office Building,
Washington, D.C.

DEAR SENATOR BAKER: Pursuant to my testimony on October 14, 1971 before the Senate Commerce Committee, and with particular reference to your interrogation, I have your October 19, 1971 request in the form of supplemental questions for completion of that record.

The questions and answers are listed below in sequence for your information:

1. During testimony at the hearings you testified that small claims had been paid an excess of $2\frac{1}{2}$ to $4\frac{1}{2}$ times their loss. Would you please supply the statistical basis for this statement?

A. The statistical base for my answer can be found in two places within the U.S. Department of Transportation's summary report titled "Motor Vehicle Crash Losses and Their Compensation in the United States."

On page 41 in Table 13 it is shown that 92.4% of all paid claimants under the tort system have an average economic loss of \$333. The table indicates that the average claim payment to the persons is \$830. Thus, approximately $2\frac{1}{2}$ times the economic loss is paid in disposition of those claims. On page 36 of the report in Table 9, it is shown that fatally or seriously injured accident victims with an economic loss less than \$500 averaged a tort recovery of $4\frac{1}{2}$ times economic loss.

These tables were originally published in the earlier fact finding volumes, the former in "Automobile Personal Injury Claims" (pp. 19, 32 & 53) and the latter in "Economic Consequences of Automobile Accident Injuries" (p. 47).

2. What portion of the estimated 27 percent reduction set forth in your testimony is attributable to administrative cost savings? To a reduction in costs of small claims as discussed in Question 1 above? Please supply statistical basis for these calculations.

A. The Appendix attached to our formal statement of October 14, 1971 will be helpful in answering your question. More detail exists in the content of our voluminous cost study completed in mid-1968 which provided statistical support

for the enclosed yellow pamphlet distributed by our organization in October, 1968 when we first announced the AIA complete no-fault plan.

Administrative savings will come chiefly from the claims administrative and claims investigative area because "causation" and relevance to legal liability will be eliminated as a predicate for payment. Instead, "occurrence", a factor which is the predicate for payment of insurance benefits under other first party systems, will be the criterion. There will still be investigative and administrative expense of a lesser degree in connection with nature and extent of injury. On balance, I believe we can safely estimate savings of 50% in this area from the present system's approximate 15¢ out of every premium dollar, or about 7%.

In terms of reduction of payments on small claims, may I refer to our AIA cost study that provides a significant figure to supplement the answer to Question 1. In a survey of some 18,000 bodily injury claims, we found that cases involving economic loss of \$100 or less were being disposed of at 7½ times economic loss. A substantial number of bodily injury claims in the total spectrum fall within that category and the overpayment here for general damages is noteworthy. The nature of the fault system and the need to provide for defense costs in threat of litigation, cause insurance companies to pay more on these cases because the economics of the situation bring it about.

We have called attention to the overcompensation of claimants with modest economic loss as opposed to the undercompensation or non-compensation of claimants with substantial economic losses. Our cost study, the Rockefeller-Stewart New York report and supporting data, and the Department of Transportation statistics all bear out the potential of substantial savings from elimination of "pain and suffering" money to claimants with low economic losses.

In addition to administrative cost savings, and savings in the field of general damages, savings are also obtainable from defense attorney fees. The report on automobile accident litigation by the Federal Judicial Center for DOT cited the average cost of defense attorneys in all litigated matters irrespective of ultimate loss payments, to be approximately \$820. The great bulk of that average payment is related to the issue of "causation" and not to the nature and extent of injury.

You posed an additional question at page 353 of the transcript of proceedings which requested information on the cost implications if a compulsory system of unlimited liability for automobile accidents were to be established in this country. As soon as I have received some additional information, I will respond to that question to the best of my ability.

We hope that our answers have been responsive. If you feel additional data is required, please feel free to contact me.

Very truly yours,

MELVIN L. STARK.

Vice President—Government Affairs.

Senator HART. Our committee next welcomes Senator Jack Davies of the State of Minnesota.

Senator Davies, we have heard about your work. We are delighted to see you here this morning. I know that you have been involved in this effort and have been an effective voice to correct some of the problems that have been highlighted by that DOT study. We are glad that you are here.

Let me put your statement in the record in full, if there is no objection. If there is any reaction you want to add as you go along, we would welcome that, too.

STATEMENT OF JACK DAVIES, MEMBER, MINNESOTA STATE SENATE; PROFESSOR OF LAW, WILLIAM MITCHELL COLLEGE, ST. PAUL, MINN.; AND COMMISSIONER, UNIFORM STATE LAWS, STATE OF MINNESOTA

Mr. DAVIES. Thank you very much Senator.

My name is Jack Davies. I am a professor at William Mitchell College of Law in St. Paul, and a commissioner on uniform state laws.

Since 1959 I have also been a member of the Minnesota State Senate.

Early in our 1967 legislative session, I introduced a no-fault bill and have been working vigorously on the issue since that time. Included in my efforts is an April 1970 article in the *Minnesota Law Review* presenting my bill with comments explaining the policy judgments reflected in its various provisions.

Since May of this year, I have spent 14 full days working as a member of the drafting committee for the Uniform Motor Vehicle Accident Reparations Act, a no-fault project of the National Conference of Commissioners on Uniform State Laws.

I want the no-fault insurance system implemented as early as possible because I know the benefits this system will bring to the citizens of Minnesota and other States. I would like to accomplish that reform through the Minnesota legislature and through other State legislatures, but we have been frustrated in that effort, as this committee well knows. Therefore, I endorse affirmative congressional action on S. 945.

I have studied Committee Print No. 1 in detail and am willing to respond to questions on its no-fault provisions if the committee desires. Many of its provisions are similar to ones I defended in hearings in the Minnesota State Legislature.

Adoption of the Hart-Magnuson bill in its present form will accomplish the objectives of the no-fault reform and be to the great advantage of the American public. It is worthy of passage without substantial modification.

However, I share the concern of most State officials that State sovereignty be preserved as much as possible. In thinking about the problem of State-Federal relationships, I recently conceived a device by which passage of the national no-fault bill can be reconciled with preservation of State sovereignty over tort law and auto insurance.

I propose that S. 945 be amended by adding a provision making the national law temporary. I propose including in the bill an expiration date 2 to 4 years after the effective date of the law. When the bill becomes effective, no-fault will be instituted nationwide. But Federal involvement would be declared to be temporary. Power and responsibility and sovereignty in the field would be returned to the States in 2, 3, or 4 years.

Senator BAKER. Would that include the right to repeal no-fault after that period of time?

Mr. DAVIES. Mr. Chairman and members of the committee. If a State failed to act, I would contemplate that particular State would go back to the fault system. But once citizens of a State have lived under a federally instituted no-fault system, its legislature unquestionably will be forced by political reality to pass a State no-fault law to prevent a return to the waste and injustice of the fault system.

Adding an expiration date to S. 945 has the advantage of protecting State jurisdiction in the long run, but promptly securing the no-fault reform for all our citizens.

The return of responsibility to individual States could be accelerated even more by allowing each State legislature at any time to make the Federal law inapplicable within the borders of the State by adopting a State no-fault act conforming to a set of minimum Federal

standards. This provision is similar to that which exists in the Federal Truth-in-Lending Act.

I understand the committee yesterday heard testimony favoring the adoption of Federal standards with a deadline for State adoption of no-fault. I can endorse that procedure as an alternative to what I have just suggested.

The committee should not get hung up on a choice between those two routes.

However, I think the expiration date approach is the more advantageous, both for getting no-fault promptly implemented and for more certainly giving the States the long-term responsibility in this area of the law. It would also have the advantage of giving the States the experience of existing under the Federal program before their individual laws are shaped.

For example, on the question of primary, secondary, we can try out the version that is in your present draft and see if it does in fact make auto primary to the extent I think it will and to the extent that I think it should. If it fails in the effort then the States may more vigorously assign to the auto policy the primary coverage.

One other modification in your bill would make a significant improvement. Earlier drafts contained a provision allocating to trucks a portion of the cost of injuries to auto occupants in cases where truck and auto collide. That provision has been deleted from Committee Print No. 1. I miss it.

In fact, apportioning to heavy vehicles some of the cost of damage arising solely because of unusual weight may be essential for justice, for appropriate allocation of costs to various economic activities and for political acceptability.

If cost transfers to heavy vehicles are not made, an operator of a truck weighing 70,000 pounds will pay to compensate for bodily injuries in highway accidents a small fraction of the per mile insurance premiums paid by owners of 4,000-pound Plymouths, Fords, and Chevrolets.

Under a no-fault system without some reallocation of cost in collisions between a car and a truck, truck insurers will pay in the usual accident a tiny fraction of the costs of the personal injuries suffered. The public will not, and should not, accept that illogical allocation of costs.

If the trucking industry interferes with prompt adoption of no-fault by haggling for the unfair subsidy inherent in Committee Print No. 1 it will be hurting itself, for no other industry has more to gain from the efficiency of the no-fault insurance system than does the trucking industry.

Conceiving and drafting a provision to accomplish the reallocation I urge is a difficult task. Everyone working in the field has struggled with it. Part of the problem is to make the provision fair. Another part of the problem is to make the provision—on reading—sound equitable.

I am submitting to the committee staff a draft which I believe accomplishes both objectives. It improves somewhat on the section originally drawn from my Minnesota bill which was included in the previous draft of S. 945.

The concept of the section I propose is this: The Department of Transportation will make statistical studies of past accidents involving heavy vehicles. From these studies the Department will calculate the average amount by which injuries to occupants of lighter vehicles are made more severe by the unusual weight of various classes of heavy vehicles.

The DOT will then allocate to each heavy vehicle, according to its weight class, responsibility for a designated percentage of loss suffered by occupants of any lighter vehicle with which it collides. The percentage will represent for vehicles of each class the average weight-caused injury—no more and no less.

The amount of cost reallocated to the larger vehicles through this provision as a matter of course will be reflected in the insurance premiums charged trucking companies.

I hope my new draft will be acceptable to the committee and will find its way into the bill reported out.

I am not pleased to come to Congress to ask you to win here the no-fault battle we have thus far lost in the State legislatures. With the kind of support and effort existing in Minnesota we should not need congressional help. But we do.

If there is any feeling that the American Insurance Association has not been sincere in its effort at the State level, I can assure you that they proved in Minnesota that they are sincere. They gave us marvelous support. We have just had a wonderful situation in Minnesota but have not been able to pass the bill.

The legislative obstacle is a simple one. In Minnesota and in almost every other State legislature the committees in control of no-fault legislation are stacked against it. The stacking occurs somewhat innocently as legislatures seek to provide expertness on each legislative committee.

Expertness comes from assigning to committees those who earn their livings in the field of committee jurisdiction. So agents and insurance lawyers are assigned to insurance committees. I feel these part-time lawmakers vote in committee to protect their vested interest in the present system.

The Minnesota statistics are revealing. The house insurance committee of 27 members has 19 agents and lawyers and, for good measure, two other members took office after election recounts in which legal counsel was provided by a particularly aggressive foe of no-fault insurance.

The Senate committee of 19 members includes 11 lawyers and agents, plus two bankers who own insurance agencies.

Changing the composition of insurance committees in the various state legislatures is a long-term project. No-fault will remain bottled up in stacked committees in most States for several more years. The no-fault reform is too vital to wait. Congress should act.

If there are those on the committee who would like to aid the special interests seeking to guard their profits from the present lawsuit system, my advice is to pass a national bill to preempt the field with a status quo law of the Illinois, Delaware, or Oregon type.

I recently received the Public Affairs Newsletter of the Kemper Insurance Group. I was startled to find Minnesota listed among seven States which have enacted no-fault laws.

Passed in Minnesota were all gimmicks and smokescreens and hollow shells—and a few honest reforms—which opponents of no-fault could think of to distract attention from my bill to abolish the fault lawsuit.

The Illinois, Delaware, and Oregon laws are not much more than what we have in Minnesota, and that is not no-fault.

The no-fault movement seeks in its essence to stop the flow of dollars down the rat hole of the third party, liability, lawsuit-insurance system and to redirect those dollars to payment of efficient first-party nonfault benefits. Any bill which does not abolish the fault lawsuit fails as a no-fault bill.

My plea to the friends of no-fault on this committee and in the Congress is to resist strenuously any bogus national bill. Preemption by a bogus national bill is the one thing which could in the long run stop the no-fault reform.

I would like to place in the record at this point several items relative to the point just made. First is this large chart which compares the legislative response to auto insurance in a number of jurisdictions.

The chart shows particularly the shallowness of the Illinois, Oregon, and Delaware effort in the key aspect of freeing the individual from the tort lawsuit system and the obligation of buying liability insurance.

Senator HART. Would you hold that chart up a little?

Mr. DAVIES. You won't be able to read it, Senator.

Senator HART. I was wondering if it was possible to reproduce it!

Without objection, it will be printed in the record.¹

Mr. DAVIES. The next items I would like to put in the record, Mr. Chairman, relate to the waste the liability insurance system entails. These charts drawn from the DOT study show that more than 25 per cent of the liability premium dollar goes to litigation and claim adjusting expense. In dollars, the total of these costs is \$2.5 billion out of the \$9.5 billion paid for auto liability insurance in 1970.

I have not really spoken much to the merits of no-fault. Since Congress financed the Department of Transportation studies and this committee has received through those studies the overwhelming statistical evidence supporting the no-fault reform, this committee should be convinced of the merits.

Any lingering theoretical doubts have been demolished by the Massachusetts experience where drivers continue to act as morally, carefully, alertly, and competently since no-fault has been adopted as they did before its enactment.

Let me describe two actual cases which have come to my attention. One was the case of a 14-year-old girl who was injured in Minnesota. She lost one leg and requires a brace on the other leg. She received a badly scarred face. The driver who negligently caused those injuries carried \$25,000 liability coverage, and from his own pocket paid another \$2,500, which raised the total money available for the girl's compensation to \$27,500.

Medical costs in the case were \$48,000. The family could not pay. So, the county picked up the medical bills. When there was a settlement made in the case, \$9,200 went to the attorney—a third went to the attorney who represented the girl and her family. The welfare department received \$15,000 as reimbursement for the medical expenses they

¹ See p. 2431.

had already incurred, which was just a fraction of those medical expenses. The girl received for the loss of a leg, scarred face, and the wearing of a brace on another leg the grand total of \$2,700, which I suspect is subject to further medical liens when you get right down to the reality of it.

In this regard I would like to submit for the record an editorial from the *Minneapolis Tribune* of June 21, 1971, commenting on this particular tragic case.

Senator HART. It will be received.

(The article follows:)

[From the Minneapolis Tribune, Monday, June 21, 1971]

WHAT IF "NO-FAULT" WERE LAW?

One argument raised consistently against "no-fault" auto insurance in the Minnesota Legislature is that benefits would be inadequate. A related argument—the "jackpot" appeal—is that, under the present lawsuit system, seriously injured victims can collect large settlements, which would be impossible under "no-fault."

It's interesting to compare those assertion with the recent settlement in Hennepin County District Court of a case involving a 14-year-old girl struck on Hwy. 12 in St. Louis Park last winter. She lost one leg, requires a brace for the other and received a badly scarred face.

The driver, who was insured for \$25,000 will add another \$2,500 to make the total settlement \$27,500. Medical costs are expected to be about \$48,000. The girl's family cannot pay them. So Hennepin County taxpayers—through the Welfare Board—will foot much of the bill. Of the \$27,500 settlement, the girl's attorney will get \$9,200; welfare gets \$15,550 as partial repayment; the girl gets \$2,750.

Under the "no-fault" proposal killed again this year by the Legislature, insurance would automatically pay the girl's entire \$48,000 medical bill, plus the full amount of justifiable additional costs for rehabilitation. The girl—not welfare, not a lawyer—would receive between \$6,600 and \$25,000 (depending upon the condition of her remaining leg), plus benefits for lost earning power.

Backers of "no-fault", supported by national studies including one by the federal government, maintain that today's lawsuit system is very expensive; that it does not provide adequate coverage; that attorneys get too much of the insurance-premium dollar; that the "jackpot" is a phantom, because most accident victims never hit it; and that seriously injured victims usually are undercompensated, while those with lesser injuries most often are overcompensated.

The girl's case certainly illustrates the arguments of "no-fault" backers. She didn't hit the jackpot. Insurance paid only about half her medical costs. No money was provided specifically for rehabilitation. The girl herself received only 10 percent of an inadequate settlement. Her attorney got three and a half times as much. One example isn't necessarily conclusive. But it suggests to us that there's a good deal more to be said for "no-fault" than its critics admit, and that the self-interest of lawyer-legislators in the lawsuit system may explain why "no-fault" bills have died in subcommittee in three consecutive legislative sessions.

Mr. DAVIES. The other case I would like to mention, Mr. Chairman, and members of the committee, relates to a student who this year is a freshman in the law school at which I teach. It is an evening law school. The student has a daytime job as an engineer. He is in his forties, is concerned about his future employability because, as a result of an auto accident, he has one leg which is very weak, one arm that is only partially useful.

I handle admissions. It is routine when someone over 35 applies that I ask them to come in for an interview to test their motivations and whether they really understand what they are getting into with a program of evening law study.

I asked him to comment on his reaction. His comments were stunning, because the disappointment in the fault system that he expressed was how long it took the girl that he injured in the auto accident to be compensated. His insurance company compensated her.

He passed over entirely the reality that although he was insured, that he had been paying premiums for years, that he had lost the substantial use of one arm and one leg, that he had received not one single cent from the insurance system. It did not seem to bother him, but it bothered me.

I think when he goes to that point in law study where he learns that the punishment should fit the crime that he will decide whatever monetary negligence or the extra drink or whatever it was that caused him to be at fault in the accident hardly justified the kind of penalty which our fault liability system imposed on him in the case of his own auto accident.

Mr. Chairman, I feel that the battle for no-fault on the merits is at an end. The battle now is a power struggle between those who realize the necessity for reform and those who profit from the inefficiency of the fault lawsuit system. I ask this committee to act on behalf of reform.

Senator HART. Senator, there is no need to tell you that your expression as one who has lived with an effort at the State level to see the adoption in Minnesota of a no-fault and the counsel you give us is welcome at least by me. I must confess I am uncomfortable when we talk about—we are inclined to be very free in our description of committees of State legislatures that are made up of 19 lawyers—there are 19 lawyers and three insurance agents, and therefore—I am a lawyer, too, and I am sitting now with another very good lawyer.

But this committee is loaded with lawyers, too, and I guess what I am saying is why do you think it is different here?

Mr. DAVIES. Mr. Chairman, I think it is different here. The lawyers in the legislature are part-time public officials, and they go back to their courthouse and to their law office at the end of the legislative session; they are in partnerships and in daily practices. Until this last session, I have defended the lawyer legislators, and I was sure they were going to come around. What I have discovered is I can get some support from those who are sole practitioners, but little support from those who are in partnerships because of the fact of the pressure they get from the partners in their office.

The reality is in the Minnesota Senate, out of the 22 lawyers, only four, including myself, supported the no-fault bill. It is a performance that speaks for itself.

Mr. Chairman, I go further to say in the rest of the body, excluding the lawyers, I have a clear majority.

Senator HART. Senator Baker?

Senator BAKER. That same testimony disturbed me. Senator, as it did Senator Hart, although I must say as a lawyer who was once active in practice and still on occasion has some nostalgic recollection of it—as my son stated, “you used to be a lawyer”—not quite for that reason. I was concerned that I thought I understood you to say or imply that no-fault had not passed because there were lawyers on the committee or because there are insurance agents and the like.

At that time it occurred to me that we heard testimony before and I believe had heard statistics from a sample done by the Department of Transportation that showed that some seven out of 10 or eight out of 10 people do not favor a change from the tort system.

I think seven out of 10 didn't favor that, and one out of 10 said we ought to go to what is equivalent to what I interpret to be a comparative negligence system. Yes, that is right.

What I am reading is the testimony of Craig Spangenberg before this committee on October 13. The public response was that it was satisfied 2 to 1. "In your opinion is there a need to change this system?" A strong majority of seven out of 10 indicated no, and one out of 10 said the change should be to a system of contributory negligence. That is, eight out of 10 citizens approved and would not wish to change a fault system based on sole negligence or comparative negligence.

As I understand it, this was a DOT study entitled "Public Attitudes."

The point I am mentioning is that coupled with some newspaper clippings I have read and other data, it would indicate that at least there is an arguable case that the public is not making a clamor for a shift to no-fault or is opposed to it. I am not really quite sure which.

In addition to being a lawyer, I am also a full-time legislator. If there is one thing I can verify, it is that legislators tend to resonate fairly well to their constituents. I wonder if you could not make an equally good argument that in Minnesota maybe the majority of people do not want no fault.

Mr. DAVIES. Mr. Chairman, Senator Baker, the nonlawyer, noninsurance agent legislators of Minnesota are responding to what they hear from the public, and a clear majority of them favors no fault. What they hear from the public in Minnesota, aside from what comes to them in their personal mail, shows up in a Minnesota poll, which is very well thought of as a public opinion survey.

There was a poll in April of 1969 which showed 62 percent favoring no fault and 31 percent of the Minnesota residents opposed to it. There were two more recent polls this spring. One was on April 18 and the other on June 27 of this year. They both showed 54 and 53 percent favorable, 30 and 29 percent unfavorable, and 16 and 18 percent undecided.

In Minnesota, we have had a 4-year campaign of education, and the public understands the issue and the public supports it, and that part of the legislature which is not lawyer, which is not insurance agent, supports the bill.

Senator BAKER. I am still troubled by the implications of venality that go with that. I won't press it any further. That is Minnesota's concern.

Mr. DAVIES. I am disturbed by your use of the word "venality." I think that the problem is a certain stubborn, closedmindedness among the lawyer-legislators.

Senator BAKER. As strange as it may seem I am reassured that you use "stubbornness" rather than "venality."

Mr. DAVIES. One of the problems, frankly, is that the best, the strongest, the most imaginative, the most creative legislators generally are the lawyers. It is hard to pass something that is new and creative and far reaching without their help.

Senator BAKER. You make a very convincing case, particularly for the idea that in Minnesota there is a great popular support for no fault.

I have two other questions, Mr. Chairman, that I would like to put.

First, in the illustration you gave us of the young man who negligently injured another party and his concern for the delay in his liability carrier paying benefit to her, that is a countercomplaint, and I am not sure it is criticism of the tort system as much as it is criticism of insurance companies. But, be that as it may, I wonder if in the example you made you couldn't reach the results you want; that is, some element of redress on the part of the negligent driver notwithstanding his negligence with something far short of no fault? I wonder if there isn't a way to do that without destroying the tort system?

Mr. DAVIES. Mr. Chairman, Senator Baker, we are going to see that in the Illinois law, because they have added some no-fault benefits on top of the present system. You can do all kinds of things if you are willing to pay the price, the dollar price. I think what we have to do is get some efficiency in this system in order to make it possible for the public to buy adequate no-fault benefits, first party benefits. We really can't do the one without doing the other.

Senator BAKER. Why can't you? Why is it necessary in order to have no-fault, that is, first party coverage? Why is it necessary to extinguish the rights of other people, which in the case of the testimony of the last witness number over 10 million?

Mr. DAVIES. Because for every element of the fault system that you preserve, for every dollar of benefit that is delivered through the fault insurance system, you have \$1.07 of overhead. In contrast, for every dollar of first party no-fault benefit that we deliver, we will have only 30 to 25 cents overhead.

I think that the difference is just a better buy.

Senator BAKER. You mean that you would effect a savings between 25 cents and \$1.07, whatever it is, in administrative overhead at the price of extinguishing the rights of 10 million people?

Mr. DAVIES. Mr. Chairman, let me speak to the rights that you speak of. You spoke of the one young man who failed to buy insurance but was not at fault in the accident. My reaction is that the young man first of all is irresponsible in not making his legitimate contribution to the insurance pool from which he proposes to collect. The uninsured motorist is a freeloader. We first of all don't have too much sympathy for the freeloader.

Senator BAKER. Isn't there a distinction in the moral concern or the sympathy that is shown toward a freeloader who must bear the consequences of freeloading himself versus a freeloader who injures someone else?

Mr. DAVIES. Mr. Chairman, that is one of the reasons why I favor going from a third party system to a first party system. Today's freeloader freeloads at the expense of his innocent victim. Under a first party system, as Committee Print No. 1 now exists, the freeloader freeloads at his own risk.

Senator BAKER. And the other fellow's too?

Mr. DAVIES. Not at all at the other person's, because any passenger in his car would recover from the assigned claims plan and the occupants of another vehicle would be going against that vehicle. A pedestrian would also recover from the assigned claims plan.

Senator BAKER. If it was covered?

Mr. DAVIES. There has to be coverage. You are describing the situation where two uninsureds run into each other. Of course, then they are each in the same boat.

Mr. Chairman, I think there is a solution to Senator Baker's problem.

Senator HART. I was suggesting to him that he didn't have a problem.

Mr. DAVIES. He does have a very slight problem, and I have a very simple solution to that very slight problem.

Senator BAKER. I have a strong suspicion that it is not going to suit me. But you go right ahead.

Mr. DAVIES. It will solve your problem. So if that is what you are looking for, it will suit.

Senator BAKER. That is what I am looking for.

Mr. DAVIES. The Committee Print No. 1 is similar to the bill that I had in Minnesota, where an uninsured motorist was left out of the system. He didn't pay for insurance, so he didn't get insurance. In the deliberations on our uniform act, I learned something. I learned that we could provide a sanction against the uninsured motorist, the free-loader. I propose that they be allowed to go to the assigned claims and get their compensation, but there will be deducted from what they get as compensation a fine of some sum of money, \$500, \$1,000, something like that, plus a fine of all the insurance premiums that they have evaded over the past years by breaking the law and driving as an uninsured motorist.

Senator BAKER. That is not my problem. It is one of them. But the other one is this 10½ million people who are not the pedestrian who when for example, walking down the side of the highway and someone with gross negligence ran them down. It is my understanding that they receive compensation from the assigned risk pool, notwithstanding the negligent driver was not insured; is that right?

Mr. DAVIES. True.

Senator BAKER. To what extent?

Mr. SUTCLIFFE. If they were not members of a car-owning family, they would receive it to the extent that present law would allow them to recover. If they were members of a car-owning family and there was an election as to an intangible loss and that election had been negative, they would recover only the economic loss suffered. But it would be compensation for total economic loss suffered because of that injury.

In other words, you have two categories. If, in fact, that person is not a member of a car-owning family, hasn't been subject to the election of whether he takes tangible or intangible loss, he is totally covered under the assigned claims plan.

Senator BAKER. To what extent?

Mr. SUTCLIFFE. Without limitation, only measured by the applicable law of the State tort law on the assumption the person would have been negligent. Whether the person was or was not negligent is not important. It is on the assumption that he was negligent to get the measure of damages. So you get tangible loss and intangible loss.

Mr. DAVIES. Mr. Chairman, I would suggest that to permit the uninsured motorist himself to go to the assigned claims plan and recover

with this penalty provision is not unfair and would work, and it would be much simpler than anything we could do to the present system to allow the 45 percent who are excluded entirely because of the fault concept to get something out of the insurance system although retaining the fault concept.

Mr. Chairman, while the committee is thinking of another question for me, previous testimony I think focused for the moment on the proposition of deterrence. I would like to suggest that the no-fault system—if you are willing to accept the idea that what happens after the accident ever has any deterrent effect on how people drive—the no-fault system spreads that deterrent a little wider than the present system does. Now, if you are dead right as you speed along, the other person has to pay 100 percent, so there is no premium on defensive driving. Just obey the rules, and the other person will have to pay.

Under the no-fault system we expect there will be deductibles applicable and those deductibles will be applicable to every claim. So even the innocent driver will have to pay \$100 or \$50, depending on what kind of a policy he buys. Everyone is going to face that economic deterrent. So we do not in fact give up an economic deterrent by adopting the no-fault system.

However, I personally don't believe the after-accident conditions have any deterrent value whatsoever.

Senator HART. On that one, I raised the question of Mr. Stark, as he indicated it was a slow ball. I sensed that he would swing as he did—

Senator BAKER. And missed.

Senator HART. Let me try my answer. I think many of the areas we are talking about have complexity, but on this one, I am a legislator with a closed mind.

To tell me that my driving attitude or suggest that the driving attitude of other people is affected by what kind of automobile insurance is or isn't available, I just can't buy. I can understand, I think I, too, am affected by my desire to avoid physical suffering. I know I am liable to get hurt if I am careless. That has a deterrent effect. And I am not sure when the policeman is around the corner, so that has a deterrent effect. And I may be vain about my car, I don't like to get it scratched or worse, or I may depend on the car and be deterred by inconvenience if it is laid up.

These things in one's common experience are deterrents, and if the cumulative effect of all those deterrents doesn't deter, the kind of policy, as I say, to me isn't important. Is that an answer?

Senator BAKER. That is an answer, Senator Hart, but I don't think it was an answer on the question that I was trying to put to the previous witness. I don't doubt for a moment that every element you have described and identified is a deterrent, and there is one omitted: you may not wish to injure another person. That is the greatest deterrent, but that does not necessarily exclude the deterrent that one hates to be sued, one hates to be charged with negligence; one hates to pay a judgment; one hates to be subject to punitive damages; and most of all one would hate to be uninsured under these circumstances.

I believe that deterrent would be added to the list as well. I do not contend for a moment that our present system is a pure-fault system. It has been modified to the point it is a contract reparation system.

the extent of 80 or 85 percent of the accidents involved. But it seems to me there is an additional deterrent involved which is implicit in the tort system. The question is whether we are going to give up one of the deterrents, not all of them.

Mr. DAVIES. I have before me a couple of paragraphs from the DOT study on deterrents which, if it is appropriate, I would like to read into the record.

Senator HART. All right.

Mr. DAVIES. The DOT study said :

In order to be effective, the deterrents depends on the presence of three factors. First, there must be strong social sanction for the use of punitive or deterrent methods. Second, the potential offender should be sufficiently susceptible to societal sanction or pressures so he responds to the full extent to which he is capable to the wishes of the community. Finally, the potential offender must in fact be capable of changing his behavior in the intended direction. The actual effects of deterrence measures on the general driving public are poorly understood. There is, however, strong evidence that with respect to highway safety, no one of the three factors described above exist to a sufficient degree to permit deterrence to function very effectively. As we show in this section, our society does not really sanction strong deterrent measures. The most flagrant offenders are affected only minimally, if at all, by societal pressures, and many among those who would respond to the wishes of the community are prevented from doing so by either personal or environmental factors or both.

Senator HART. If I could, let me note for the record that the excerpt that was in Mr. Spangenberg's testimony yesterday and to which Senator Baker made reference today suggesting two-thirds of the people were satisfied with the existing automobile insurance system did, in fact, come from the DOT study, but I would ask that the full analysis be made a part of the record, and I will ask staff to include it.

It shows after a little discussion and description of the nature of the system and alternative systems that 65 percent figure just about reverses.

(The information follows:)

E. PUBLIC OPINION: COMPLAINTS AND ATTITUDES ABOUT AUTOMOBILE INSURANCE

Increasingly vocal public concern over the operation of the automobile insurance system has been a major force in attracting the interest of government at all levels. Indeed, public concern led to the creation of the Department of Transportation's Automobile Insurance and Compensation Study.

Any institution that directly and substantially affects the lives of three out of every four American families is bound to generate at least some consumer dissatisfaction. During the course of the Study, the Department became a natural collection point for citizen complaint letters about auto insurance. A selection of these letters were sent to the companies involved for comment. The complainants were contacted and asked for additional information.¹

It is an indication of how strongly these complainants felt that 80 percent of them responded even though they were advised that the Department of Transportation had no power to assist them.² About 40 percent of these complainants considered their complaints still open, despite the fact that many were concerned with matters several years old. Only 26 percent of those that believed their complaints were resolved felt justice had been done.

Although no formal adjudications of the facts in dispute could be made, many of these complaints appeared to be unwarranted in the context of the present insurance system. Others reflected gross misconceptions about the operation of the system or the respective rights of insureds, claimants or insurance companies. Many of the complaints, however, did appear to be justified. In some cases, the company admitted error and frequently gave evidence of going to considerable lengths to rectify it. In still other cases, neither the company nor the complainant appeared, either in a legal or moral sense, to be completely "right."

One study of consumer complaints about automobile insurance indicated that non-standard (i.e., high-risk) companies are responsible for a disproportionate

¹ Public Attitudes, pp. 137-266.

² *Ibid.*, p. 140.

number of complaints. This study, based on the experience of four jurisdictions—California, Illinois, West Virginia and the District of Columbia—revealed that while high-risk companies had from 5 to 11 percent of the market, their share of complaints ranged from 14 to 48 percent of the total analyzed.³ While the distribution of complaints by type varied from one jurisdiction to another, delay of claims payment, disputes of the value of the loss and denial of coverage accounted for slightly over 70 percent of all complaints.⁴

One of the Department's principal concerns was to find out what the public thinks and feels about the present automobile insurance system. To this end, two large-scale surveys were conducted, one of the general public and the other of persons known to have been seriously injured in automobile accidents.⁵ In general, these surveys indicate that the public has mixed attitudes about the performance of various aspects of the system, is generally ill-informed about the current system, and, on the whole, shows an openness to change when made aware of alternatives to the present system.

When respondents to the survey of the general public were asked to mention what they felt were the good and bad points of auto insurance, most mentioned both kinds of features. However, while most references to desirable features were couched in the form of generalities, references to undesirable features tended to be specific, relating to rising costs, fear of cancellation and delays in the settlement of claims.⁶ Only 8 percent of the general public could think of more than one favorable point and 17 percent were unable to think of any; however, 27 percent mentioned two or more unfavorable features while only 12 percent could think of none. The most frequently stated undesirable aspect of auto insurance was high or rising cost (44 percent of all respondents), policy cancellation or nonrenewal (11 percent), and delay in claims by others or against large loss (37 percent)—a function which perhaps could be equally well provided by alternative systems—and good service (12 percent) were most frequently mentioned as good points.

A motorist's level of satisfaction with the system might logically be expected to be related to his experience with it. As reflected by an Index of Satisfaction—a measure combining the responses to several questions⁷—respondents with personal injury accident experience during the two-year period prior to the interview, either personally or by association with another family member, tended to be less satisfied than respondents with property damage or no accident experience (Table 24). One likely explanation is the widespread possession of collision insurance that pays auto damage costs without regard to fault and also facilitates third-party recovery. Indeed, the Index shows that the level of satisfaction for persons with first-party claims is significantly greater than that of third-party claimants (Table 25).

TABLE 24.—INDEX OF SATISFACTION OF THE GENERAL PUBLIC WITH AUTO INSURANCE BY TYPE OF AUTO ACCIDENT

[Percentage distribution of car-owning families]

| Level of satisfaction | Type of accident | | |
|--|------------------|----------------------|-------------|
| | Personal injury | Property damage only | No accident |
| Very satisfied..... | 18 | 24 | 27 |
| Generally and somewhat satisfied, and pro-con..... | 53 | 52 | 59 |
| Dissatisfied..... | 29 | 24 | 20 |

TABLE 25.—INDEX OF SATISFACTION OF THE GENERAL PUBLIC WITH AUTO INSURANCE BY TYPE OF INSURANCE CLAIM

[Percentage distribution of car-owning families with accidents]

| Level of satisfaction | Type of claim | |
|--|---------------|----------|
| | 1st party | 3d party |
| Very satisfied..... | 31 | 20 |
| Generally and somewhat satisfied, and pro-con..... | 47 | 53 |
| Dissatisfied..... | 22 | 27 |
| Total..... | 100 | 100 |

Source: Public Attitudes, p. 110.

The Index also reflects the much greater degree of dissatisfaction with auto insurance on the part of motorists living in the central cities of the twelve largest Standard Metropolitan Statistical Areas (SMSA's) as compared to those living in all other sections of the country (Table 26). The relatively high cost of automobile insurance protection in urban areas, the problem of court delay and the greater difficulty in obtaining and keeping insurance are all reasonable explanations for the differences.

TABLE 26.—INDEX OF SATISFACTION OF THE GENERAL PUBLIC WITH AUTO INSURANCE BY DEGREE OF URBANIZATION

[Percentage distribution of car-owning families]

| Level of satisfaction | Respondent's residence | |
|--|------------------------|-------------|
| | 12 largest SMSA's | Other areas |
| Very satisfied..... | 13 | 22 |
| Generally and somewhat satisfied, and pro-con..... | 49 | 58 |
| Dissatisfied..... | 38 | 20 |
| Total..... | 100 | 100 |

Source: Public Attitudes, p. 112.

When asked whether they had ever personally experienced cancellation or non-renewal, 14 percent of the car-owning families replied affirmatively.⁹ Excluding those motorists who were themselves cancelled, more than half of all respondents, particularly youthful motorists, had *heard* of others who had been cancelled. Most respondents who were cancelled or denied renewal purchased other insurance, but low income people were more likely than others to go without insurance after a cancellation.⁹

One of the more important observations to be drawn from this survey of the general public was that a substantial number of motorists do not clearly understand how the fault system is intended to work. Nearly 30 percent of all respondents believed that they could collect from a third-party insurer when partly at fault in an accident with another driver.¹⁰ Another 14 percent did not know whether they could or could not collect. Those with significant direct recent experience with the system, in this case seriously injured victims, showed a better understanding of the fault doctrine with only 21 percent replying incorrectly and 12 percent not knowing.¹¹

A comparison of the seriously injured victims' responses with those of the general car-owning public to a series of attitudinal questions on the reasons for carrying automobile insurance indicates that the former tend to attach greater relative

⁹ *Ibid.*, p. 35.¹⁰ *Ibid.*, p. 37.¹¹ *Ibid.*, pp. 71-72.¹² Public Attitudes Supplement, p. 36.

importance to all reasons.¹² One of the largest differences between the two groups concerned their feelings about compensation for "pain and suffering" caused by an accident. Sixty-four percent of the seriously injured victims considered this a "very important" reason for carrying auto insurance, while only 46 percent of the general public expressed the same attitude.¹³ Fifteen percent of the general public thought it was "not at all important," but only 7 percent of the seriously injured victims agreed.

As the interview developed and respondents gained additional knowledge of the present system and a possible alternative to it (i.e., no-fault insurance), the general public tended to express less satisfaction with liability insurance and tended to favor a no-fault system (Table 27). When first asked whether based on their experience they were or were not satisfied with auto insurance, 65 percent of respondents replied with some degree of satisfaction while 22 percent were dissatisfied. Later, after a brief description of auto liability insurance, the level of dissatisfaction increased; 56 percent indicated satisfaction while 28 percent displayed dissatisfaction. Respondents were then given a brief description of an alternative, no-fault insurance system and were asked for their reaction. The pattern of responses to this question very closely matched that relating to the evaluation of the liability system. In both cases close to 60 percent replied favorably to what had been described. Either respondents changed their opinion upon learning about a no-fault alternative or else they did not see any contradiction in approving two different insurance systems.

TABLE 27.—ATTITUDES OF THE GENERAL PUBLIC TOWARD FAULT AND NO-FAULT INSURANCE

[Percentage of car-owning families]

| Level of satisfaction | Question relating to— | | |
|--|------------------------------|----------------------------|-------------------------------|
| | Experience with fault system | Evaluation of fault system | Evaluation of no-fault system |
| Very, generally, and somewhat satisfied..... | 65 | 56 | 57 |
| Pro-con..... | 6 | 4 | 2 |
| Generally dissatisfied..... | 22 | 28 | 30 |
| Other..... | 7 | 12 | 11 |
| Total..... | 100 | 100 | 100 |

Source: Public Attitudes, pp. 18 and 73.

The views of seriously injured victims to these same three questions generally paralleled those of the general population, tending to be somewhat more extreme (Table 28). On the question relating to experience with auto insurance, seriously injured victims were clearly less satisfied than the general public, with only 50 percent—compared to 65 percent—voicing satisfaction. Almost half (46 percent) of seriously injured victims expressed some dissatisfaction with the present system. One-third of those dissatisfied expressed only moderate dissatisfaction but the other two-thirds answered an unqualified "dissatisfied."

As in the case of the general public, a majority of seriously injured auto accident victims (62 percent) evaluated a brief description of no-fault insurance favorably; and fewer of these respondents were opposed to the no-fault system as described. Once again, respondents either did not see any contradiction in their views on fault and no-fault, or they changed their opinion after becoming aware of an alternative to tort liability.

In the final part of both survey interviews, respondents were given descriptions of two alternative types of automobile insurance (i.e., fault and no-fault) and asked to choose between them.¹⁴ The descriptions were brief, but included the major points of both systems. Because of the desire for brevity and simplicity, the description of fault insurance did not explicitly exclude the first-party coverage which is available within the existing system as a supplement to liability insurance, though it did focus on the third-party liability aspects of insurance. The description of no-fault insurance did not emphasize certainty of payment, an integral part of most such systems that have been proposed.

In response to this choice question, 40 percent of the general public opted for no-fault without qualification, another 15 percent preferred it if the cost were lower and 35 percent favored the present system even if it were more costly (Table 29). Among seriously injured victims, 39 percent chose no-fault without qualification, 9 percent more would choose it if the cost were lower and 39 percent favored the status quo. Accident victims who had recovered under tort understandably showed a greater tendency to favor the fault system than those who had not recovered under tort.

TABLE 29.—COMPARISON OF EXPRESSED CHOICE BETWEEN FAULT AND NO-FAULT INSURANCE FOR THE GENERAL PUBLIC AND SERIOUSLY INJURED VICTIMS

| [In percent] | | |
|--|----------------|---------------------------|
| Choice between systems | General public | Seriously injured victims |
| Favors no-fault..... | 40 | 39 |
| Favors no-fault only if less costly..... | 15 | 9 |
| Favors fault even if more costly..... | 35 | 39 |
| Undecided/not ascertained..... | 10 | 13 |
| Total..... | 100 | 100 |

Source: Public Attitudes Supplement, p. 18.

The descriptions of the fault and no-fault systems used in the foregoing "choice" question stressed that the former sometimes paid an additional amount for "pain and suffering" while the latter did not. This matter was addressed in another question which asked if compensation for "pain and suffering" should be eliminated if that would reduce insurance costs. Fifty-three percent of the respondents answered affirmatively, 37 percent negatively and 10 percent gave no opinion.¹⁵

The expression "pain and suffering" is widely used in insurance circles and elsewhere to connote the entire range of intangible or "general" damages including inconvenience, mental anguish, emotional distress, denial of future happiness or vocational opportunity because of disfigurement, physical impairment, loss of limb, sight or other bodily function, etc. It is more than probable that the majority of the respondents did not have a complete understanding of the full meaning of the term "pain and suffering," in particular the fact that it encompasses the more serious kinds of intangible loss. This likelihood, however, by no means undermines the usefulness of the responses to the survey's questions. Most accident liability claims involving personal injury do not involve serious kinds of intangible loss. For example, a survey of paid personal injury liability claims showed that only 7.6 percent involved permanent disability, permanent disfigurement or death.¹⁶ Moreover, it would appear that liability insurance payments to such victims, on the average, do not even approach their economic

¹⁴ A description of the alternative systems can be found in *Public Attitudes Supplement*, p. 16.

¹⁵ *Public Attitudes*, p. 66.

¹⁶ *Automobile Personal Injury Claims*, p. 19.

losses. Average total economic loss (including lost future earnings) for fatally injured victims was estimated at \$22,894; liability insurance payments averaged \$10,981. Average total economic loss for permanently and totally disabled victims was \$78,000; liability insurance payment averaged \$12,558.¹⁷

Indeed, it is clear that most of "pain and suffering" dollars are going to victims with relatively minor, transient injuries who experience their "pain and suffering" in the literal dictionary sense of the term. That a majority of the public would be willing to forego compensation for these hard to measure intangible losses is important.

A provocative point to consider is that the overwhelming majority of respondents to the attitudinal survey of the general public who were involved in multi-car accidents believed that the "other driver" was at fault (Table 30). Since fault obviously has been attributed wrongly to the "other driver" in some unknown but large number of cases, it would have been interesting to learn whether the respondents to both surveys who favorably evaluated the fault system and expressed preference for liability insurance over no-fault insurance still would hold these opinions if the actual "guilty" part were known.

TABLE 30.—OPINION OF THE GENERAL PUBLIC ABOUT WHO WAS AT FAULT IN MULTICAR ACCIDENTS

[In percent]

| Opinion on fault | Property damage only | Personal injury |
|---------------------|----------------------|-----------------|
| Family member..... | 26 | 18 |
| Both drivers..... | 4 | 3 |
| Other driver..... | 65 | 76 |
| No one/unknown..... | 6 | 4 |
| Total..... | 100 | 100 |

In evaluating these responses, it should be recognized that any question asked of a large group of people concerning their satisfaction with an existing institution is likely to carry a built-in bias in favor of that institution. While there may often be a number of complainers or fault-finders, there will also be a sizeable percentage of people who accept the status quo as they have had no negative experience to make them question it. Many of these people have given no thought to their auto insurance; they pay their premiums when they are billed, and are grateful for the feeling of being protected. It is not surprising, therefore, that when asked whether they were satisfied with their auto insurance two out of three of the general car-owning public said that they were. Understandably, those who had been seriously hurt in an auto accident and who most likely had had recent experience with auto insurance were differently conditioned as a group; only half of them expressed satisfaction.

By the time in the interview when the respondents were asked about their evaluation of and choice between fault and no-fault systems, their understanding of auto insurance had been somewhat clarified and their experiences and reactions had been recalled to their minds. Respondents showed a definite interest in preference for a no-fault system.

No survey on an issue as complex as automobile insurance can claim to be perfect in every way. Some may be subject to errors of construction (e.g., simplicity vs. complexity of questions and inadequacy vs. abundance of information provided to respondents); some may be subject to errors of sampling (e.g., the representativeness of the sample to the population); and some may be subject to errors of response (e.g., misinterpretation of questions). Each of these possible sources of error can produce substantially different results to seemingly similar questions. Moreover, small variations in phrasing can lead to different responses. A question written as "Car insurance companies have the duty to provide insurance for all people who need it" will likely evoke a different response than an alternate wording as "Car insurance companies should have the right to refuse to insure some people." Thus, although the responses to several public opinion surveys

¹⁷ *Ibid.*, p. 53.

sponsored by various segments of the insurance industry at times conflict with the results of the Department's two surveys, after carefully reviewing each one, the basic validity of the results of the Department's surveys appears unimpaired.

One of the things that is apparent from all these attitude surveys, from the complaint letters of insurance buyers and claimants, and indeed, from almost any investigation of the consumer and his auto insurance is how imperfectly the consumer comprehends the insurance product and institution. This holds true of the existing system, and would hold true of possible changes or alternatives to it.

Large numbers of consumers appear to be unhappy with auto insurance today, largely with its cost but also with the effects of market constrictions. When insurance consumers become claimants, especially third-party claimants, the focus of their unhappiness shifts to the conduct of the insurance company. Consumers would appear to be open to change, especially if it would reduce costs. The shift in opinions observed during the two public opinion surveys conducted for the Department of Transportation from general satisfaction with the present automobile liability insurance system to an approval of substantial changes makes it probable that the wide-spread availability of more information about such alternatives as a no-fault plan will increase the support for a change in the present system.

Mr. DAVIES. Senator, the same thing happened in the Minnesota poll. They asked a naked question, then they explained some of the tradeoffs, and got 50 percent of the negatives to change their position in the process of the polltaking.

Senator BAKER. You mean the polltakers changed their minds?

Mr. DAVIES. In the process of just explaining what the first question meant. That was one of the very early polls in Minnesota before there had been public education on the issue.

Senator BAKER. How many people under Committee Print No. 1, according to your interpretation, would not be entitled to benefits based on your estimate of the number of people who would be insured and those who would not be insured?

Did you hear the testimony of the previous witness?

Mr. DAVIES. I heard the testimony. As I understand it, the only individuals excluded are those who are in the process of committing a crime or who are motor vehicle owners who have not bought insurance in violation of the law.

Senator BAKER. And they are completely out of the system according to Committee Print No. 1?

Mr. DAVIES. I yield to the staff on that. That is my understanding.

Mr. SUTCLIFFE. That is correct.

Senator BAKER. And there would be 10.5 million of them?

Mr. DAVIES. Mr. Chairman, I go with Mr. Stark in his estimate that when you are insuring for your own benefit, you are much more apt to buy the insurance than you are when you are buying for somebody else's protection and you happen to be a judgment proof—

Senator BAKER. I really don't think that is why I buy liability insurance for someone else's protection. I think it is for my protection. Wholly aside from that, what I am trying to arrive at is not the merits of the controversy, but some estimate that I can feel relatively comfortable with of the number of people that would be involved in this situation, that is, the number of people who would not be under the system.

Mr. SUTCLIFFE. I am sorry, there has been confusion. I think it is important to straighten out the confusion, because under the committee print, the tort exemption applies only to the owner, operator, or user of an insured motor vehicle.

So that those people who chose not to insure under the qualifying no-fault policy would then automatically subject themselves to the very tort liability that Senator Baker is suggesting we have abolished with the tort exemption.

So, not only do you have the assigned claims plan, but those people who are injured by an uninsured motorist have recourse to that uninsured motorist under the existing tort liability scheme.

And that appears in the committee print, section 3(a) on page 12, line 1.

Mr. DAVIES. Mr. Chairman, if I could pursue that. We now insure the 85 percent of the public that is motivated, as Senator Baker is and as I am and as Senator Hart is, as is everybody in this room. We choose to pay our share. Under a no-fault system, we are speaking of an additional motivation on that other 15 percent.

If you want to get your loss of earnings and your medical expenses paid if you are injured in an auto accident, you are going to have to pay. There is no other way to get that.

We are working on the 15 percent through the first party system and I think very effectively.

Mr. SUTCLIFFE. Senator, there was some suggestion in your testimony that the committee print reflects a decision to give a subsidy to the trucking industry. I am not sure that that suggestion is accurate, but let me explore the present liability system and the present responsibility for truck operations.

Under the liability system you would think there would be a very strong incentive to operate the vehicles in such a manner as to not antagonize the accident environment situation because these truckers have so-called deep pockets under the liability situation.

Is that a fair statement?

Mr. DAVIES. I think the trucking industry tries very hard to keep its accident involvement at a minimum, certainly.

Mr. SUTCLIFFE. By assessing greater premium to the trucking industry under a first-party system, how are you operating any differently than at the present time of assessing greater premiums because of the deep-pocket theory of the tort liability system?

In other words, what greater incentives are you providing to prevent the collision of a very large vehicle with a very small vehicle on our highways?

Mr. DAVIES. The draft that I submitted to staff makes the truck pay only in those circumstances where it is actually involved in an accident. So, to the extent—

Mr. SUTCLIFFE. In other words, it is a loss shift operation after the fact?

Mr. DAVIES. Yes; accident by accident, but a predetermined percentage. In other words, a semitrailer truck would be rated ahead of time x number of tons weight, it would be, say, a 70-percent reallocation if it collides with an ordinary passenger vehicle.

That would automatically happen every time the truck and a car came into collision. Even if the car ran into the back end of the truck, the truck could—

Mr. SUTCLIFFE. But this would be without regard to fault?

Mr. DAVIES. Without regard to fault, yes. It is simply an effort to isolate the weight factor as an injury-causing factor. I think to the extent that weight is an injury-causing factor that that cost should fall on the heavy vehicles.

Mr. SUTCLIFFE. But isn't the goal the prevention of the collision of those larger vehicles with smaller vehicles to the extent possible?

Mr. DAVIES. Certainly, certainly. But they are going to happen.

Mr. SUTCLIFFE. But if they are going to happen, why are you assigning a greater cost to the heavier vehicle?

In other words, why don't you assign a greater cost to the Cadillac than the Volkswagen because that same kind of weight disparity causes greater intrusion into the compact car by the heavier vehicle?

Mr. DAVIES. The theory of the section could be extended to the Cadillac-Volkswagen distinction. I chose in my draft, as a policy judgment to lump the passenger automobiles into a single class.

Mr. SUTCLIFFE. That is what I am after. What is the policy reason for assigning a greater share of the cost to the heavier vehicle? You could make the exact opposite conclusion and assign a greater cost to the smaller vehicle that is on the roadway with the heavier car or truck, because it is the lightness of the vehicle that causes it as much as the heaviness of the vehicle.

Mr. DAVIES. What causes the accident—

Mr. SUTCLIFFE. I am not talking about the causation of the accident. I am talking about the causation of the damage.

Mr. DAVIES. Let me lay a foundation for my reasoning. The accident occurs because both vehicles happen to be in that vicinity and one or the other or both—or the road conditions—cause them to come into contact.

At that point, if we have a first party system where the insurer of each vehicle covers only the losses of his own vehicle, in the normal case the occupants of the auto would be seriously injured, it would be high insurance cost to their insurer. The truck driver would not be injured at all or very slightly injured, and there would be very low cost.

But the reality of causation of injury in that circumstance was that the many tons of weight represented in that truck caused the injury to be more severe.

I don't know if this will help focus, but we had a collision on a freeway in Minnesota between a Volkswagen and a semitrailer in which the truckdriver was killed and the Volkswagen driver was uninjured. It was a front page story, unbelievable. The public does not expect that to happen and the public would expect the big vehicle to be responsible for the very serious damage that it typically causes.

Mr. SUTCLIFFE. So, your policy is to try to determine who should bear a cost?

Mr. DAVIES. Just an appropriate allocation of cost.

Mr. SUTCLIFFE. For the use of the larger vehicles on our roads and highways?

Mr. DAVIES. True. I don't believe that the draft has any penalty for the large vehicle whatsoever. It just has an appropriate allocation of cost.

Mr. SUTCLIFFE. This would be analogous to requiring trucks using interstate highways to pay a Federal motor vehicle tax for fuel consumption?

Mr. DAVIES. Just as they wear away the pavement faster than the Volkswagen, so they create more costs in the form of bodily injury.

Mr. SUTCLIFFE. You would only assess that tax on those people on a random basis who were involved in accidents with smaller vehicles?

Mr. DAVIES. True, If one trucking company through a good selection of drivers, good training programs, good maintenance of vehicles and so on was able to keep its accident involvement at an extremely low level, their experience rating by their insurer would be very, very fine. They would pay lower premiums than a company that was more careless with its driver selection and had a greater degree of accident involvement.

Mr. SUTCLIFFE. Whereas that same theory applied to a heavier vehicle on our highway, if it was a passenger motor vehicle, wouldn't have the fallout of possible accident avoidance of what you are suggesting it might have in the trucking industry?

Mr. DAVIES. I do not deny your point that the rationale of this section applies exactly the same to the Volkswagen-Cadillac collision as it does between the semitrailer and the passenger vehicle.

The rationale is the same. I just felt that the law can't make all its distinctions so precisely, and that it would be more practical in administration to lump the passenger vehicles.

Mr. SUTCLIFFE. Thank you very much.

That clarifies the issue for me.

Senator HART. Senator, you have, as you see, stimulated all of us. Thank you very much.

(The statement follows:)

STATEMENT OF JACK DAVIES, PROFESSOR, WILLIAM MITCHELL COLLEGE OF LAW, ST. PAUL, MINN.

Mr. Chairman, members of the committee. My name is Jack Davies. I'm a professor at William Mitchell College of Law in St. Paul, and a Commissioner on Uniform State Laws. Since 1959 I have also been a member of the Minnesota State Senate. Early in our 1967 legislative session I introduced a no-fault bill and have been working vigorously on the issue since that time. Included in my efforts is an April 1970 article in the Minnesota Law Review presenting my bill with comments explaining the policy judgments reflected in its various provisions. Since May of this year I have spent 14 full days working as a member of the drafting committee for the Uniform Motor Vehicle Accident Reparations Act, a no-fault project of the National Conference of Commissioners on Uniform State Laws.

I want the no-fault insurance system implemented as early as possible because I know the benefits this system will bring to the citizens of Minnesota and other states. I would like to accomplish that reform through the Minnesota legislature and through other state legislatures, but we have been frustrated in that effort. Therefore I endorse affirmative Congressional action on S 945. I have studied committee print one in detail and am willing to respond to questions on its no-fault provisions if the committee desires. Many of its provisions are similar to ones I defended in hearings in the Minnesota State legislature.

Adoption of the Hart-Magnuson bill in its present form will accomplish the objectives of the no-fault reform and be to the great advantage of the American public. It is worthy of passage without modification.

However, I share the concern of most state officials that state sovereignty be preserved as much as possible. In thinking about the problem of state-federal relationships I recently conceived a device by which passage of the national no-

fault bill can be reconciled with preservation of state sovereignty over tort law and auto insurance.

I propose that S 945 be amended by adding a provision making the national law temporary. I propose including in the bill an expiration date two to four years after the effective date of the law. When the bill becomes effective no-fault will be instituted nationwide. Power and responsibility and sovereignty in the field would be returned to the states in two, three or four years.

Once citizens of a state have lived under a federally instituted no-fault system, its legislature unquestionably will be forced politically to pass a state no-fault law to prevent a return to the waste and injustice of the fault system. Adding an expiration date to S 945 has the advantage of protecting state jurisdiction in the long run, but promptly securing the no-fault reform for all our citizens.

The return of responsibility to individual states could be accelerated even more by allowing each state legislature at any time to make the federal law inapplicable within the borders of the state by adopting a state no-fault act conforming to a set of minimum federal standards. This provision exists in the federal truth-in-lending act.

One other modification would significantly improve the bill. Earlier drafts contained a provision allocating to trucks a portion of the costs of injury to auto occupants in cases where truck and auto collide. That provision has been deleted from committee print one. I miss it. In fact, apportioning to heavy vehicles some of the cost of damage arising solely because of unusual weight may be essential for justice, for appropriate allocation of costs to various economic activities and for political acceptability. If cost transfers to heavy vehicles are not made, an operator of a truck weighing 70,000 pounds will pay to compensate for bodily injuries in highway accidents a small fraction of the per mile insurance premiums paid by owners of 4000 pound Plymouths, Fords and Chevrolets. Under a no-fault system without some reallocation of cost in collisions between a car and a truck, truck insurers will pay in the usual case a tiny fraction of the costs of the personal injuries suffered. The public will not, and should not, accept that illogical allocation of costs.

If the trucking industry interferes with prompt adoption of no-fault by haggling for the unfair subsidy inherent in committee print one it will be hurting itself. No other industry has more to gain from the efficiency of the no-fault insurance system.

Conceiving and drafting a provision to accomplish the reallocation I urge is a difficult task. Everyone working in the field has struggled with it. Part of the problem is to make the provision fair. Another part of the problem is to make the provision—on reading—sound equitable. I am submitting to the committee staff a draft which I believe accomplishes both objectives. It improves somewhat on the section originally drawn from my Minnesota bill which was included in the previous draft of S 945.

The concept of the section I propose is this: the Department of Transportation will make statistical studies of past accidents involving heavy vehicles. From these studies the department will calculate the average amount by which injuries to occupants of lighter vehicles are made more severe by the unusual weight of various classes of heavy vehicles. The DOT will then allocate to each heavy vehicle, according to its weight class, responsibility for a designated percentage of loss suffered by occupants of any lighter vehicle with which it collides. The percentage will represent for vehicles of each class the average *weight-caused injury*—no more and no less. The amount of cost reallocated to the larger vehicles through this provision will be reflected in the insurance premiums charged trucking companies.

I hope my new draft will be acceptable to the committee and will find its way into the bill reported out.

I'm not pleased to come to Congress to ask you to win here the no-fault battle we have thus far lost in the state legislatures. With the kind of support and effort existing in Minnesota we should not need Congressional help. But we do. The legislative obstacle is a simple one. In Minnesota and in almost every other state legislature, the committees in control of no-fault legislation are stacked against it. The stacking occurs somewhat innocently as legislatures seek to provide expertness on each legislative committee. Expertness comes from assigning to committees those who earn their livings in the field of committee jurisdiction. So agents and insurance lawyers are assigned to insurance committees. They vote in committee to protect their vested interest in the present system.

Mr. SUTCLIFFE. This would be analogous to requiring trucks using interstate highways to pay a Federal motor vehicle tax for fuel consumption?

Mr. DAVIES. Just as they wear away the pavement faster than the Volkswagen, so they create more costs in the form of bodily injury.

Mr. SUTCLIFFE. You would only assess that tax on those people on a random basis who were involved in accidents with smaller vehicles?

Mr. DAVIES. True, If one trucking company through a good selection of drivers, good training programs, good maintenance of vehicles and so on was able to keep its accident involvement at an extremely low level, their experience rating by their insurer would be very, very fine. They would pay lower premiums than a company that was more careless with its driver selection and had a greater degree of accident involvement.

Mr. SUTCLIFFE. Whereas that same theory applied to a heavier vehicle on our highway, if it was a passenger motor vehicle, wouldn't have the fallout of possible accident avoidance of what you are suggesting it might have in the trucking industry?

Mr. DAVIES. I do not deny your point that the rationale of this section applies exactly the same to the Volkswagen-Cadillac collision as it does between the semitrailer and the passenger vehicle.

The rationale is the same. I just felt that the law can't make all its distinctions so precisely, and that it would be more practical in administration to lump the passenger vehicles.

Mr. SUTCLIFFE. Thank you very much.

That clarifies the issue for me.

Senator HART. Senator, you have, as you see, stimulated all of us. Thank you very much.

(The statement follows:)

STATEMENT OF JACK DAVIES, PROFESSOR, WILLIAM MITCHELL COLLEGE OF LAW, ST. PAUL, MINN.

Mr. Chairman, members of the committee. My name is Jack Davies. I'm a professor at William Mitchell College of Law in St. Paul, and a Commissioner on Uniform State Laws. Since 1959 I have also been a member of the Minnesota State Senate. Early in our 1967 legislative session I introduced a no-fault bill and have been working vigorously on the issue since that time. If the trucking industry interferes with prompt adoption of no-fault by haggling for the unfair subsidy inherent in committee print one it will be hurting itself. No other industry has more to gain from the efficiency of the no-fault insurance system.

Conceiving and drafting a provision to accomplish the reallocation I urge is a difficult task. Everyone working in the field has struggled with it. Part of the problem is to make the provision fair. Another part of the problem is to make the provision—on reading—sound equitable. I am submitting to the committee staff a draft which I believe accomplishes both objectives. It improves somewhat on the section originally drawn from my Minnesota bill which was included in the previous draft of S 945.

The concept of the section I propose is this: the Department of Transportation will make statistical studies of past accidents involving heavy vehicles. From these studies the department will calculate the average amount by which injuries to occupants of lighter vehicles are made more severe by the unusual weight of various classes of heavy vehicles. The DOT will then allocate to each heavy vehicle, according to its weight class, responsibility for a designated percentage of loss suffered by occupants of any lighter vehicle with which it collides. The percentage will represent for vehicles of each class the average *weight-caused injury*—no more and no less. The amount of cost reallocated to the larger vehicles through this provision will be reflected in the insurance premiums charged trucking companies.

I hope my new draft will be acceptable to the committee and will find its way into the bill reported out.

I'm not pleased to come to Congress to ask you to win here the no-fault battle we have thus far lost in the state legislatures. With the kind of support and effort existing in Minnesota we should not need Congressional help. But we do. The legislative obstacle is a simple one. In Minnesota and in almost every other state legislature, the committees in control of no-fault legislation are stacked against it. The stacking occurs somewhat innocently as legislatures seek to provide expertness on each legislative committee. Expertness comes from assigning to committees those who earn their livings in the field of committee jurisdiction. So agents and insurance lawyers are assigned to insurance committees. They vote in committee to protect their vested interest in the present system.

The Minnesota statistics are revealing. The house insurance committee of 27 members has 19 agents and lawyers. For good measure two other members took office after election recounts in which legal counsel was provided by a particularly aggressive foe of no-fault.

The Senate committee of 19 members includes 11 lawyers and agents, plus two bankers who own insurance agencies.

Changing the composition of insurance committees in the various state legislatures is a long term project. No-fault will remain bottled up in stacked committees in most states for several more years. The no-fault reform is too vital to wait. Congress should act.

If there are those on the committee who would like to aid the special interests seeking to guard their profits from the present lawsuit system, my advice is to preempt the field with a status quo law of the Illinois, Delaware, or Oregon type. I recently received the Public Affairs Newsletter of the Kemper Insurance Group. I was startled to find Minnesota listed among seven states which "have enacted no-fault laws." Passed in Minnesota were all gimmicks and smoke-screens and hollow shells—and honest reforms—which opponents of no-fault could think of to distract attention from my bill to abolish the fault lawsuit. The Illinois, Delaware, and Oregon laws are not much more than what we have in Minnesota and that is not no-fault. The no-fault movement seeks in its essence to stop the flow of dollars down the rat-hole of the third-party, liability, lawsuit insurance system and to redirect those dollars to payment of efficient first-party non-fault benefits. Any bill which does not abolish the fault lawsuit fails as a no-fault bill. My plea to the friends of no-fault on this committee and in the Congress is to resist strenuously any phony national bill. Preemption by a bad national bill is the one thing which could in the long run stop the no-fault reform.

I have not spoken to the merits of no-fault. Since Congress financed the Department of Transportation studies and this committee has received through those studies the overwhelming statistical evidence supporting the no-fault reform, this committee should be convinced of the merits. Any lingering theoretical doubts have been demolished by the Massachusetts experience where drivers continue to act as morally, carefully, alertly, and competently since no-fault has been adopted as they did before its enactment.

The battle on the merits is at an end. The battle now is a power struggle between those who realize the necessity for reform and those who profit from the inefficiency of the fault lawsuit system. I ask this committee to act on behalf of reform.

We had hoped we might be able to hear all of the witnesses and not delay them for a luncheon break, but it being 12:35, I would suggest a recess to resume at 1:45.

(Whereupon, at 12:35 p.m., the hearing was recessed, to reconvene at 1:45 p.m., this same day.)

AFTERNOON SESSION

Senator HART. The committee will be in order.

Let me welcome the commissioner of insurance of the State of California, Richards Barger. Commissioner, let me order printed in the record in full your statement. As you go along, particularly if you would like to respond to any of the things that have been exchanged here this morning, feel free to do so.

STATEMENT OF RICHARDS D. BARGER, INSURANCE COMMISSIONER, STATE OF CALIFORNIA

Mr. BARGER. Thank you, Senator. I would like to first of all thank the committee for allowing me to appear and you, Senator Hart, for allowing me time on your crowded agenda to present the thoughts of the National Association of Insurance Commissioners on this very important bill.

My name is Richards D. Barger. Today I am appearing on behalf of the National Association of Insurance Commissioners, commonly referred to as the NAIC, both as the insurance commissioner of the State of California, and as president of the NAIC. Having its inception in and regular meetings since 1871, the NAIC is the oldest voluntary association of State officials. It includes the principal insurance regulatory authorities of the 50 States, the District of Columbia, and the territories of the United States.

The proposed National No-fault Motor Vehicle Act, as revised in Committee Print No. 1, poses two fundamental issues:

(1) To what extent should the concept of fault be eliminated from the legal and automobile insurance system and how might it best be tested and implemented, and (2) if the system is changed, how should it be regulated?

On May 13, Commissioner Lorne R. Worthington, the past president of the NAIC, testified before this committee on the original version of S. 945 which also posed these two basic issues in a somewhat different form. As to the issue of No-fault, the NAIC recommends the experimentation on a State-by-State basis to resolve this complex and varying problem. The State-by-State approach provides a means to do so in a manner responsive to the public's choice in the marketplace between the benefits it wants at costs it's willing to pay.

I think this is very important. The reasons for this conclusion are spelled out in Commissioner Worthington's statement and we will not repeat them there. Subsequently at the NAIC meeting in June, the following resolution was adopted, which I will not recite.

It refers to the fact that the auto reparation systems currently in force do not uniformly and adequately compensate all injured parties, that they often fail to provide prompt payments of insured losses, and fail to equitably distribute the claims dollar among all victims and claimants.

Based on those recitals we say there should be:

- (1) Prompt payment for economic loss;
- (2) Distribution of the auto insurance claims dollar in such a manner that a close relationship is developed between the benefits delivered to each injured party and his actual economic loss; and
- (3) Distribution of a larger percentage of the premium dollar to parties suffering economic loss.

I might deviate for a moment, if I might. There is one further factor that I think is very important, and I would like to refer to that as the commissioner from California. I think cost is a very vital factor in this whole thing. One of the great clamors for reform in the automobile reparations system is based upon cost and the fact that the public is very concerned about the increasing cost of automobile insurance.

Let me note that State insurance regulation has no vested interest in either eliminating or continuing the third-party legal liability system for automobile insurance. We currently oversee both fault and No-fault type coverages. What is ultimately in the best interest of the public is what we favor and support. The problem is determining what is ultimately in the public interest.

Today we shall concentrate on the second basic issue—i.e., how should the system, if changed, be regulated. As an essential backdrop,

let me briefly highlight the State insurance regulatory mechanism which is both broad and detailed. For example—

(1) Insurers must obtain and continue their licenses in order to do business. This, in turn, requires complying with statutes and regulations pertaining to formation, financial standards concerning assets, capital and surplus, permissible investments, adequacy of reserves, and qualifications as to character of management, experience and knowledge of the business. Licenses may be suspended or revoked for failure to comply with the law or when the public interest so requires.

(2) Insurers must file comprehensive annual and other periodic reports under oath in each State in which they do business. This is on an annual form required by the NAIC which gives us information. The NAIC annual statement requires detailed information concerning financial condition, underwriting, investments, reserves et cetera.

(3) Insurers are subject to comprehensive periodic examinations to, among other things, ascertain the financial condition of the company—and in our State we have rating examinations as to how companies charge the public for automobile types of insurance.

(4) By virtue of statutory standards on policy content and the commissioners' policy form approval or disapproval power, much of the source of misrepresentation or other unfair practices is deterred in advance.

(5) Control is exercised over the pricing practices of property and liability insurers by implementing either through prior approval or subsequent review the standards that rates shall not be excessive, inadequate nor unfairly discriminatory between the same classes of insurers.

(6) Market practices are controlled by, among other things, laws governing the qualifications of agents and brokers, licensing of the same, prohibitions against certain practices such as false and misleading advertising—I might state in this regard the NAIC has put out a study on mass advertising which I would recommend for your perusal, because I think it is a fine piece of work—and representations, defining standards of fair competition, control over policy forms, rate controls in several areas, and department investigations of complaints.

(7) The insurance commissioner may, for a variety of causes (e.g., insolvency, refusal to comply with orders, failure to remove officers, et cetera), apply for a court order of liquidation, rehabilitation, or conservation.

(8) Among the sanctions available for enforcement of the insurance laws are criminal and civil penalties, cease and desist orders; injunctions; removal of officers and directors; fines; and revocation of or refusal to renew licenses of agents, adjusters, brokers, and insurers. These express powers and sanctions, plus the informal powers, sanctions, and alternative modes of relief stemming therefrom, extend far beyond what is being talked about in connection with the proposed Federal bill.

Supplementing the efforts of the individual States has been the NAIC which is a 100-year-old organization consisting of the insurance commissioners of the several States. The NAIC has sought to promote uniformity where appropriate, develop model laws and regu-

lations for use in various States, and conduct various types of studies and research projects. The NAIC, as a whole, meets twice a year. Various committees meet during the interim. In addition, a central research office has been established, of which Mr. Hanson, on my right, is the executive director. Thus the NAIC provides a flexible and timely facility to develop and implement change. In short, the NAIC has served as a mechanism to improve regulation and has provided impetus for change.

Committee Print No. 1 vests a wide range of regulatory powers in the Secretary. However, the Secretary may be defined by the omissions left in the bill. Several of these are listed in the footnote on my prepared statement. In evaluating such provisions, we think it is important to differentiate between the goals being sought and the techniques used to achieve such goals. Once the goals are delineated, we are in a better position to evaluate alternative approaches to achieve them. The primary insurance regulatory goals implicit in Committee Print No. 1 seem to be as follows:

- (1) Policy provisions which are fair and equitable;
- (2) Development of meaningful cost information affording the public a reasonable opportunity to compare price and quality of the product; and
- (3) Assurance that coverage availability extends to all meeting the eligibility requirements.

If the no-fault concept, as embodied in this bill is adopted, few, if any, would quarrel with these regulatory goals. However, questions are posed in evaluating the manner of their effectuation:

- (a) Do the techniques embodied in the statute seem reasonably calculated to achieve their precise goal?
- (b) If so, does it conflict with other objectives equally or more important?
- (c) Are there preferable alternatives?

Let us briefly review each of these goals with these questions in mind.

I refer to the provisions for our fair and equitable policy provisions. Section 5(d)(1) vests in the Secretary approval power over policy terms, conditions, exclusions, deductibles, coverages, and benefits if such are fair and equitable. The use of policy approval power is a time-honored insurance regulatory technique to achieve this goal. In fact, it is standard practice in every State, either before or after the sale of that particular policy. Numerous individuals in the various State insurance departments, with countless numbers of years of experience and expertise, receive and scrutinize insurance company policy forms before they can be issued to the public, or after they are issued to the public, which is the case in our State in automobile insurance. Their purpose is to assure that the policies conform to applicable law, whether State or Federal. Changes must also be approved. A pattern of policyholder complaints, if any, will lead to subsequent review and possible withdrawal of approval. I might say, Senator, in our State we coordinate the number of complaints from the public with our legal department who approve policy forms and most kinds of insurance on our rating examination so we can have some kind of coordination between the complaints that the public has and how they relate to

certain policy provisions to the next time we review the company's books or approve their policy forms. We then are able to make improvements on their forms to eliminate these complaints by the public. In short, the same goal and technique already exists at the State level. State approval procedures will continue, even if a similar mechanism is adopted at the Federal level as proposed by this bill, since each insurance department is charged with the responsibility of seeing that insurers comply with that State's requirements. Repeating the same goal in a Federal statute and creating a Federal approved procedure would seem to be needless duplication in terms of time, effort, and the taxpayer dollars.

Secondly, relating to price information, both section 5(d)(1) and section 6 seek to develop meaningful cost information to enable the public to compare company prices and claims and loss experience. This is sought through the establishment by the Secretary of a common uniform statistical plan for allocation and compilation of claims and loss experience to be followed by every insurer. To accomplish the purpose of the statistical plan, the Secretary would be authorized to prescribe uniform policy provisions, classes of risk and rating territories for each coverage (section 6(d)). Section 5(d)(1)—approval power over policy terms discussed above—relates to limiting the variety of coverages available; its purpose is to give buyers a reasonable opportunity to compare the costs of various insurers as well as to assure fair and equitable policies. Each insurer will submit to the Secretary the actual rates it charges (section 6(e)). The Secretary is then directed to make available to the general public a comparison of each insurer's "indicated rate" based solely on claims and loss experience and the actual rate being charged for each class of risk in each territory. The goal of providing increased meaningful price information to the public is a valuable one. We concede this, but at the same time the technique suggested to do so needs to be evaluated in terms of its impact on other objectives.

First, the establishment of uniform policy provisions, classifications, and rating territories will rigidify a system at a time when experimentation and innovation are most important. Digressing for a moment, I would like to relate to you the California experience. As you are I am sure well aware, since 1947 we have had an open competition type rating law that does not impose any perimeters of conduct upon the companies in terms of innovating in classifications of risks, rates, and policy forms. We have found that the public in our State has been the beneficiary of the ability of the companies to innovate in terms of different driving classifications, different types of policies, and different types of rates. I think it would be a serious mistake to impose certain parameters of conduct upon the insurers, because I think the public ultimately will suffer if this is done.

The elimination of the fault concept and the shift to an entirely first party no-fault coverage will revolutionize the writing of automobile insurance. I think even its proponents will concede that, sir. Policy forms and rating techniques will undergo substantial transformation.

In any undertaking of this magnitude and complexity, no person or persons can reasonably be expected to "devine" the proper course to take in buying automobile insurance. Yet the assumption of omni-

science is implicit in the provision for establishing nationwide uniformity in policy provisions, classifications, rating territories, et cetera. What is needed is a period of trial and error—a shakedown period on a State by State basis—giving both the industry and the public the maximum opportunity to learn and select. Only in this manner is there a reasonable likelihood that the best techniques and approaches will emerge over the long run for the benefit of the general public.

Second, if the States retain the regulatory power, the likelihood of improved regulation, as the proposed no-fault system evolves, would be greatly enhanced. Change could then originate from any one of several sources whereas the national regulatory approach limits the initiative for change and improvement to one source—i.e., the Federal Government.

Third, if the fault concept is eliminated for automobile insurance, it can be anticipated that some, if not several, life and health insurance companies will enter the field and compete for this business. Such a development offers intriguing possibilities and new thinking redounding to the benefit of the insurance-buying public. However, the imposition of a straightjacket of uniformity could seriously impair, if not derail, this promising development.

Fourth, the sponsors of S. 945, as well as many others, have endorsed the concept of expanded utilization of the mass marketing concept as a means to reduce the cost of automobile insurance. I have already referred to our NAIC report on mass merchandising. As is documented by the NAIC central office staff study on Mass Marketing, significant momentum has and is continuing to develop in this area. As is the case in most marketing developments, insurers are feeling their way by experimenting with those types of programs, coverages and underwriting which they feel can appropriately be undertaken. However, if their freedom to experiment is frozen, this promising development conceivably could be arrested in its infancy, thereby eliminating possible cost savings to the insured from marketing efficiencies and/or employer contributions.

I might say I am not espousing that this be done, but I say it is a development that is going to happen at some point in time somewhere in the foreseeable future.

Five, Committee Print No. 1 does not purport—nor does the staff analysis suggest—that the bill would regulate rates. Yet for the purposes of a statistical plan, a Federal regulatory agency would be vested with control over classification and rating territories, both fundamental elements in ratemaking. This would severely disrupt the existing regulatory pattern. Also it could result in Federal establishment of national groupings which may be less relevant when applied to local situations.

Furthermore, the elaborate statistical scheme proposed in this bill—designed to provide meaningful cost information to the public—appears to be quite impractical. Remember, we are not dealing with a single national rate structure. Rates will vary by territories and their classifications. Under a competitive system, rates are being constantly changed. I have already referred to that.

Hundreds of companies write automobile insurance. To provide timely information on a multitude of insurers, each having a multi-

tude of rates in an economic environment fostering frequent rate changes, presents a Herculean task. Publication of comparative rates and experience will most likely be out of date before the public has an opportunity to receive and absorb it. In other words, this scheme would not provide timely—i.e., meaningful—information for the public. Some States have attempted to grapple with this problem and found it to be a difficult one to solve. The proposed scheme in the bill, in our judgment, oversimplifies the problem. Thus, not only does the proposal conflict with other objectives embodied in the bill, it does not offer a practical solution to even achieve its stated goal.

In short, while we concur in the goal of improved cost information for the public, at the same time we submit that the techniques proposed—such as a uniform policy provision, rating territories, classifications, et cetera—would adversely impinge upon the long-term sound development of the proposed non-fault automobile insurance program. That is, techniques embodied in Committee Print No. 1 would inhibit the flexibility necessary for a meaningful “shakedown” period, would lessen the likelihood of improved and responsive regulation as the system develops, could deter the influx of life and health insurance company involvement, might arrest the development of mass marketing, and would disrupt the State regulatory pattern.

As it now exists today, section 7 authorizes the secretary to organize an assigned claims bureau and assigned claims plan to enable each person or his legal representative sustaining injury or death to obtain the benefits prescribed by statute if no insurance benefits under a qualifying policy are applicable, identifiable, or payable due to an insurer's financial inability to perform. The assigned claims mechanism is proposed as a means to make available protection that would not otherwise be forthcoming.

Developing a mechanism to provide coverage in residual areas is not uncommon. State insurance regulators have substantial experience in this area. Assigned risk plans for automobile insurance exist in every State. Approximately half of the States found it appropriate to institute FAIR plans to provide property insurance coverage in urban areas. Nearly all States have enacted guaranty fund legislation to protect insureds and claimants in the event an insurer becomes insolvent. The proposed assigned claims bureau is another variant on the same theme.

Some may question the assigned claims approach as being the best technique. In the development of the FAIR plans, this concept was originally considered and then abandoned in favor of the pool concept of one type or another. This is not to say that the assigned risk approach is wrong, but rather its superiority has not been proven to the point that it should be mandated for all States in all circumstances. Furthermore, because of State expertise and willingness to grapple with residual problems such as this, the responsibility for assuring the availability of residual coverage should be left with the States to be solved with the peculiar problem of each State in mind.

I think a good example is in your State of Michigan, Senator, they have a very successful assigned claims plan where anyone who registers his automobile must either provide evidence of insurance or must pay a flat fee, and this money grows into the assigned claims fund.

Senator HARR. Commissioner, on that point, this committee earlier heard from the administrator of that fund, our Secretary of State, Mr. Austin, and he describes it a little differently than you do in terms of the degree of satisfaction. There are two problems with it.

Number one, the legislature has already tapped it for \$44 million for the general fund, and number two, many people think it is a form of insurance.

Mr. BARGER. We have been reviewing it in some detail as a possibility in California. I am glad to hear your remarks, because I am going to call Mr. Austin. We have had it touted very highly to us, and I am glad you told me.

Senator HARR. He is an extremely competent person, and I know it would be helpful if you talked to him.

Mr. BARGER. I was going to say it may not be the answer for those of us in California, we may desire some other vehicle as an answer to this problem.

In the above discussion we have attempted to differentiate between objectives and the means or techniques to achieve those objectives. The insurance regulatory objectives (as distinguished from the objective of reforming the automobile reparation system on a non-fault basis) implicit in Committee Print No. 1 are threefold: (1) fair and equitable policies, (2) provision of meaningful cost information, and (3) assurance of availability of benefits to those so entitled. We concur in the objectives; we disagree as to the means proposed.

A fundamental factor in evaluating alternative means is one's view on the issue of State versus Federal regulation. It is not our purpose today to delve into this debate in detail. We only note here that utilization of the State insurance regulatory mechanism possess the advantage that it already exists with 50 State insurance departments having over 4,500 employees and budgets in excess of \$50 million. Furthermore, State regulation is closer to the public and hence more responsive to the policyholder demands. It facilitates experimentation since the gravity of a mistake is severely limited. It tends to be more responsive in the presence of the continuous threat of congressional removal of its jurisdiction. And, it is consistent with the fundamental concept of decentralization of political power.

With this backdrop, the NAIC expresses serious concern over the creation of an institutional insurance regulatory framework in a Federal agency. Such a framework at best will lead to duplication of effort, time, and taxpayers' dollars, and at worst, will, over the long run, undermine the effective and viable system of State insurance regulation. Furthermore, the insurance regulatory provisions are only incidental aspects and not an integral part of the committee print's proposed nonfault program.

As stated above, we believe that the enactment of the nonfault concept at the Federal level would be inappropriate. If at some future point in time Congress decides to adopt a Federal no-fault program in some form as a matter of national policy, we recommend that no existing insurance regulatory authority be vested in any Federal agency. This would require deletion of such provisions as sections 5 (d) (1), 6, and 7 of print No. 1 of the committee. The responsibility for insurance regulation should remain with the States. The insur-

ance regulatory goals of the State insurance departments are consistent with those implicit in the statute, as discussed above. The States possess the expertise. The NAIC provides a facility and impetus for change and, where appropriate, for uniformity. Thus, it is logical and reasonable to expect the States to fulfill this responsibility. We submit that in the long run this approach is in the best interest of the insurance-buying public.

That concludes my formal and prepared remarks, Senator. You asked if I could make some observations on some of the testimony I heard this morning, and I will now slip into my position as the California Insurance Commissioner, because that concludes my prepared remarks on behalf of the NAIC.

Senator HART. Thank you for the remarks reflecting the feeling of the NAIC.

Now, you tell us as the insurance commissioner of California about some of the things you heard this morning.

Mr. BARGER. As you are well aware, we have had some experience this year with several proposals sponsored in the California Legislature. One bill was successful in getting through one house of the legislature, the other was not. My feeling is very simply this.

No. 1, that most State legislators are not yet convinced that inaction on their part will lead to Federal action. That is point No. 1.

No. 2, I am not convinced that most legislators are really aware of the fact that there is a public demand for some change in the reparations system. I think the reason for this is that there has been no grassroots clamoring for it yet.

No. 3, my deliberations on the problem, and as a lawyer they have been rather soul searching, have led me to believe that the system has to be changed in many material respects, but at the same time there really is no classic solution to the problem.

No. 4, because there are certain inherent assumptions built into any proposal, whether they be by the proponents of the proposal or by the opponents of the proposal. The validity of these assumptions will determine the success of the plan.

Unfortunately, the ultimate payor for someone's mistakes are the premium-paying public of the country.

No. 5, I personally am not yet convinced based upon my observations, at this point in time, that pure no-fault is ultimately going to benefit the public in terms of cost saving or politically it is possible to be enacted yet.

I do say, however, certain parts of the system have to be improved before we can understand whether pure no-fault will work, and I mean meaningfully improved. When I say meaningfully improved I mean changes in the area of pain and suffering. Limitations on general damages (pain and suffering) are the real issue the opponents of change "zero in" on—these opponents of the bar who deal with auto negligence cases.

I am convinced that if you are going to lay any first-party system upon the present system that you are going to have to accomplish some savings elsewhere within the system and the area of pain and suffering is the area where you can accomplish these savings.

At the same time, I do not think it is fair to penalize those who are seriously injured. I mean seriously injured. So, consequently, Senator,

in our proposals in California we propose limitations on pain and suffering in the so-called smaller cases and we also supported the series of bills authored by Senator John Harmer that sought to accomplish this. Later, after the defeat of Senator Harmer's bills, we supported Assemblyman Fenton's bill that imposed a threshold.

Both these proposals had very liberal first-party coverage, but it became obvious to us that if you only lay on first-party coverage alone upon the present third-party system, as the trial lawyers want to do in California, it is going to increase the portion of the premium for liability protection by one-third.

I don't think the public is going to stand still for that. I would not want to be the legislator that was responsible for passing it.

What I am trying to say to you is the legislators in the several States have not gotten the message yet; by the same token, I think it is unfair to impose a 1-year or 2-year perimeter of action upon the States because, as you are well aware from the testimony, any change in the system is going to impose changes upon a long-established socio-economic system of law, and it isn't going to come easy, as you are well aware.

So, I am saying this to you, that the action has to be continuous at the State level because we are not going to have any significant results unless we do.

By the same token, I think that the States are not entitled to an open end on action. They have to be told unless something is done within a responsible period of time that the Federal Government is going to act. I think that is the message that I am trying to get through to you today as the Commissioner from California.

We have gone through one session of the legislature and I think I can speak with some authority having had the lumps and bruises to show for it, and would and will do it all over again.

I think many insurance commissioners feel that way.

Senator HART. You say you think most insurance commissioners feel that way. Am I to understand at conventions and informally at other times this has been the attitude voiced by most of your colleagues?

Mr. BARGER. I think so, yes. Let me point out by way of review just where some of the commissioners stand, and I don't mean to speak for them, but I have talked to them about the problem.

You are familiar with former Superintendent Stewart of New York and his views about the reparation system. Commissioner Van Hooser feels the same way as I do. Whether you agree with the way he did it or not, Commissioner Baylor was one of the people responsible for change in Illinois.

I would say generally that most of the commissioners feel that some kind of a change in the system is necessary, and it is going to come to pass because we, too, are concerned about the problem.

The one thing that I always told the people who opposed our bill in Sacramento, that we were dealing with the public's money, and getting into the area of pain and suffering under the present system was at least something that was foreseeable. Our bill could be evaluated intelligently because it didn't revolutionize, it didn't change the system so dramatically, that there was no way to perceive what it was going

to cost the public. That is the reason I supported the program I did, and I have yet to be convinced that first-party coverage under "pure no-fault" is going to save the public any money.

That is just my feeling generally.

Senator HART. I would hope that the insurance commissioners of the country, if they believe it to be true, would help us on this. But we should understand that cost savings is broader than just premium cost.

If a no-fault program can compensate those thousands of people who today at the premium level, whatever it is today, are not compensated, then that is part of the savings. It may not be reflected by less premium, but our figures indicate that about \$2.5 billion of gross national product is lost each year from seriously injured persons who get incomplete compensation. If you can eliminate that loss, even though the premium volume remains the same, you have made a very substantial saving, and it is that broader concept of saving that insurance commissioners should make sure everyone understands.

Mr. BARGER. I talk about containing premium costs, because I have been very careful not to represent to any legislators that I am going to save the public money. I think that anyone representing or proposing that change in the system that is going to save money to the public is a good deal like an elected official saying he is going to save them taxes at the time he is reelected. It does not happen that way. I am not sure you can guarantee the results.

I concur with you, but unfortunately the complaints we get from the public as to what people pay for automobile insurance manifest themselves in what they pay in terms of premiums, not what they receive in terms of benefits when they are injured. That is the unfortunate fact of life.

The public in the letters we get do not equate premiums they pay with benefits paid to others.

Perhaps, Senator, you are right. So, I suppose one answer to the problem would be to put a layer of first-party benefits upon the present system, but I have taken a very strong position that at this reading is inequitable to the public because there has to be some savings elsewhere in the system to offset the increased costs of the first-party benefits.

We are talking about the same thing, but my answer is different than yours. My feeling has been at the outset that the present system shouldn't be completely junked. It should be streamlined. Then let's judge it.

Consistent with that philosophy I have tried to make the attendant savings for the first-party coverage in the smaller cases, only the smaller cases, by putting a limitation on pain and suffering.

I guess our goals are the same. Our methodology is different. That is what I am trying to say to you.

The irony of it is in our first proposal in Sacramento authored by Senator Harris, that I just related to you, is that some of the people who support your bill here opposed our bill.

Now, I happen to think automobile reparations is like religion, as long as you get in the same place, you ought not to argue about the means.

Senator HART. We won't get theological about it.

Mr. BARGER. I think you know what I am trying to say.

Senator HART. I think I would have joined those in Sacramento who opposed your bill for the same reason I think that that Illinois bill is not good.

Mr. BARGER. It may well be——

Senator HART. It isn't a very substantial advance. It improves things some. Maybe your theory is if we can take those small steps, eventually we will get to the point where it will be accomplished.

In the meantime, talking about this cost, our delay is paid for by the public. While we contemplate the gradualism with which we will approach it this year, each year the consumer pays a fair amount of money.

Mr. BARGER. Let me respond to that, if I could, Senator. You may be right. I hope you are right, because if you are wrong the public is going to pay more.

Senator HART. I am generally sort of tentative about my votes and positions, but I am reasonably secure on this one, which doesn't mean it couldn't be wrong.

Now, the association is on record for an approach to insurance reform State by State. There are a great many very large population centers in this country that straddle State boundaries. We happen to be sitting in one now. The Department of Transportation itself has told us that no-fault insurance in the District of Columbia would be of very limited use unless Maryland and Virginia moved at the same level about the same time.

The Kansas Cities, St. Louis—I am told there are 30 U.S. metropolitan areas encompassing two or more States, and in those metropolitan centers live 30 million people. Now, how will the State-by-State approach ease their problem?

Mr. BARGER. It may not be a very satisfactory answer to you, but let me say I can think of a number of areas where a State-by-State approach has been followed in automobile insurance and it seems to have worked out adequately.

For instance, I used to live in the State of Indiana, and if I happened to live in Gary, Ind., and my wife and I had a disagreement that led to a divorce, I could move to Chicago, Ill. The grounds that the divorce might be different, yet I have heard no one espouse a uniform divorce law.

Senator HART. Husbands and wives and automobiles in my book are just not comparable.

Mr. BARGER. You are talking about a——

Senator HART. Maybe the mobility is about the same. I am not even sure of that.

Mr. BARGER. I don't know. I am from California. I am a poor person to ask about that, although I have only been married once.

I know what you are saying, and I think there is some merit to what you are saying, but I am saying we live in a federal system where each State is charged with responsibility for its own problems in a way it deems best fit.

It may well be that our mobile population has changed that, but I am not sure that we are at a point in time yet, Senator, where the mobility of our population is a sufficient reason to take away from the several States the right to solve their own problems.

Senator HART. The principal you suggest is valid, but there is a competing principal at work in my book. I tend to think that the other principle has an overriding claim against it, at least with respect to the consequences involved in a personal injury automobile accident, that if they add a measure of uniformity it would at least be a development for these 30 million people who live in Gary and work in Chicago or vice versa day after day.

Mr. BARGER. One of the things that makes it particularly difficult to achieve a uniform solution to the problem, not only do you have it in the political dialog that goes on between the vested interests, if you so want to call them that, the organized bar and the trial lawyers on the one hand and those seeking to reform on the other, but you have certain sections of business that say they will only by change that conforms to their idea of change, which results in a theme of variables that I think you are concerned about.

Senator HART. But there is a constant in the subject matter we are talking about. There is a hospital bed and that costs so much, and there is a physician and a surgeon and their fees are so much, whether it is in Gary or Chicago.

What is unique to the Illinois citizen as distinguished from the Indiana citizen with respect to how much it is going to hurt him when he gets hurt in a car?

Mr. BARGER. I can give you a good answer to that because it was the answer given to me in California when I originally proposed a threshold approach, and the answer is very simply this:

It costs you \$26 a day for a bed in Eureka, Calif., and it costs you twice that in San Francisco, Calif., which means that someone has to wait twice as long in Eureka to pierce the threshold as they do in San Francisco.

What I am trying to say is there are certain variables on a State-by-State basis that may require them to adopt their own certain solutions to the problem.

Senator HART. That variable is reflected in the rates, assuming the commissioner is competent. That has introduced a uniformity so far as the traveler is concerned when he gets hurt, whether it happens during a dark night in California or a noonday in Gary.

Mr. BARGER. I tried to point out in my prepared statement, if you have this system of classification of risks and rating, it imposes an inflexible system on the companies that don't allow them to take advantage of these variables.

I am departing at the moment from whether or not change in the system is necessary. I am going to the second part of the problem that I have addressed my remarks to, and I am trying to say to you, all right, conceding arguendo that what you say is right, you have to give the companies the flexibility to make classifications and territories to recognize these changes without a Federal straitjacket imposed upon them.

Senator HART. Mr. Sutcliffe.

Mr. SUTCLIFFE. Mr. Barger, assuming that you have solved the problem of reform and are now concentrating on the problem of regulatory goals that you say are set forth in Committee Print No. 1, with which you agree, how do you accomplish those goals given 50 difference insurance departments with a history of unevenness of action—some very good, some not so good. If you are setting out a na-

tional policy to correct the automobile reparations system, and it seems to me that you are saying the NAIC is not in favor of that, can you leave all regulation to the States?

If that is left to the States, what assurances could you give the Congress of the United States that there would not be an evenness in providing for policy information and level of performance, fairness and equity in a policy itself, and availability of the insurance that is mandated on a national basis?

Mr. BARGER. First of all, I think you would have to question the basic assumption of the question before you answer it. I am not sure that evenness is an absolute necessity in terms of what the public is entitled or wants—that is more important.

Mr. SUTCLIFFE. By evenness, let me clarify that for the record. A minimum level of performance assuring protection of the consumer of insurance.

Mr. BARGER. Do you mean in terms of whether they pay their claims or whether or not they are solvent, or do you mean in terms of what they are buying?

Mr. SUTCLIFFE. Both in terms of solvency, which I think should be given in any regulatory scheme, and also assurance of payment of claims upon proper presentation of proof of loss. But the more important thing is the ability to have the consumer discern what companies have the chance of serving him best so there is indeed the kind of competition that your association has gone on record in favor of.

Mr. BARGER. Well, let me say this to you, let me talk about a State where I think we probably have the greatest degree of competition that I know of because of the history of our rating law. I will give you a personal experience which I think is fairly relevant. I have two teenage drivers in my family, which makes rating shopping pretty relevant. I happen to buy my insurance from an insurance agent whose main office of the company happens to be in the city where you are from.

Every 6 months I happen to drop by the Sears Roebuck Allstate's counter just to keep my agent honest, because I want to know if what I am being charged is competitive.

I find most of my friends want to know what they could be charged by the other companies because they are aware of the competitive facts of life. In terms of whether they are getting the best bargain for their dollar, they are concerned about two things, the price they pay for their insurance, and, No. 2, the quality of claims service rendered to them if there is an accident.

The former I think is a very simple thing to discern, because the ability to do so is there. It doesn't take any genius any more to call your agent up and tell him you want a certain amount of coverage, you want 50-100 or 50-100 and \$300 and \$200 deductible, and he can tell you how much it is going to cost.

He can tell you very quickly what it is going to cost you and so can the man at the Allstate counter and so can the State Farm agent.

The claims practices is a more subjective decision on behalf of the buyer. But he soon knows, based upon his own experience with the company, as to whether or not he wants to retain them or not.

So, in those two areas, I think the buying public in my State generally have the opportunity to avail themselves of a number of coverages, because it isn't all that difficult any more to get information either from your own agent or from somebody else's agent.

You can look in a phone book under State Farm or Farmers Insurance or an independent agent.

Mr. SUTCLIFFE. I guess one of the problems is that under a third-party liability system the insurance company that you place your business with ends up oftentimes not paying you, it is paying somebody else.

Mr. BARGER. It all depends what I choose to buy. For instance, let's talk about whether he pays me or not. At present, and I am not sounding like one of the trial lawyers, but one of the few things I agree with them on is this: Today if I want to buy loss of time insurance, income replacement, I can do so. The computation of premium is based upon my economic status.

Mr. SUTCLIFFE. Can you do so without buying liability insurance?

Mr. BARGER. Yes. I buy it as a separate package. I can buy immediate pay, which is a form of first-party coverage, but really doesn't suit the purpose that I would want it for.

I could buy first loss of time, income replacement insurance, and the company's exposure as to what they charge me is based upon my age and the standard of living I want to be reimbursed for, and it is simply that.

What they charge me is not predicated upon how I am injured, how I become ill; it is predicated upon simply the fact that I am ill and they are compelled to pay me x dollars, which is really what no-fault really is, isn't it?

Mr. SUTCLIFFE. To answer that, you have to qualify it by saying to the extent you buy that coverage, you are free from the requirement to buy liability protection.

Mr. BARGER. All right, but no-fault—

Mr. SUTCLIFFE. That is the Department of Transportation's definition of no-fault, not simply the adding of first-party benefits.

Mr. BARGER. If I were able to combine with my auto policy and identify loss of time, income replacement, and medical insurance, I would really have a—and I didn't have to worry about paying the other guy—that is what no-fault really is, isn't it?

Mr. SUTCLIFFE. It is not that radical you are telling us, we already have it?

Mr. BARGER. We already have it in a different way. It is going to cost me more if I want to do it today, because I can't combine my two policies, and I can't get rid of the liability unless I refuse to purchase it and take my chances, which I am not inclined to do.

Mr. SUTCLIFFE. Let me give you a proposition and have you react to it. I think that is the more honest way to do it rather than trying through a leading question.

It seems to me that to the extent you are asking for the States to undertake without any Federal involvement the goals that you agree should be achieved, that the assurance that the States will do this may very well depend upon the uniformity of approach to the automobile insurance system.

In other words, there is a better chance of insuring proper regulation of an insurance scheme if that insurance scheme to start with is uniform, so that there is cross-fertilization and exchange of information between various insurance departments about the same general plan. Is that assertion, that proposition tenable, or is it not?

Mr. BARGER. No, it is not tenable to me, and I will tell you why. You have to look at the history of the old rating laws on the present third-party system to understand why it isn't tenable.

The success of the so-called direct writers was predicated upon them deviating from the rates established by the old rating bureaus. They were successful in deviating from the rates charged by the so-called bureau companies and the classifications established by the bureaus, and that I think is one of the reasons they have done so well in the field today.

I think that is why my presentation pointed this out inferentially. I am not sure that the whole world wears a 44 suit or that everyone should be compelled to conform to the same standard. I am not sure that the public benefits by a lack of creativity and innovation that I think they should have whether it is on a State-by-State level or not.

The matter of open competition rating laws is something of some recent—I guess the word is import.

Ten years ago it would have been very difficult to find many who would espouse the law we have in California.

I think they have come to realize because of the lack of redundancy in rates that they need this change. So, I guess in summary what I am trying to say to you is "No," it is untenable to me, because to me the greatest flexibility benefits the public.

Mr. SUTCLIFFE. Does that flexibility of regulation depend upon the need to have flexibility in the scheme that you regulate?

Mr. BARGER. Let's not equate flexibility with competence. What I am saying is in terms of their competence to regulate for rates, first of all, there are two types of rating laws.

Mr. SUTCLIFFE. I have heard about that.

Mr. BARGER. I am sure you have.

I happen to think that the several States are in a very good position to best judge the needs in those States in terms of what they want in the way of rates.

Some commissioners are adamant about prior approval law. They think they are fine; they want to keep them; they feel they protect the public.

Commissioner Preston thinks it is good for his people in the Commonwealth of Kentucky, he is in a better position to judge them than I am.

By the same token, I think I am in a better position to judge for the people of California than Commissioner Preston is.

Mr. SUTCLIFFE. Is it easier for you or Mr. Preston to determine who has the better approach if you are both regulating the same kind of scheme? Are the figures that you use and the information you have more comparable to ascertain in this experimental field that you advocate which is the better one for the consumer?

Mr. BARGER. I am not sure that you don't have it now through the so-called bureaus. There is a touch of irony in what you say, because for the first time in I don't know how many years, the Insurance

Services Office has now notified the subscribing companies that they must rely upon their own expertise and set their own rates, which I admit is a very good thing. I happen to think in the short run and long run it is in the benefit of the public. Many people have been greatly concerned about the lack of a rating law in Illinois.

I feel it is an excellent idea. I think for the first time the companies are going to be compelled on their own to set rates to be competitive. I am not sure that really the collection of data by one entity is going to change that one whit in terms of what you are trying to accomplish.

Mr. SUTCLIFFE. What would be an appropriate form for his treatment of variability problems or for his treatment of price information problems, the goals you have pointed out in the testimony?

Mr. BARGER. I know what you are saying. Let me say this to you. In a State that has some 20 million prospective insurers, we have trouble at all in our rate examination in discerning what rules of conduct are necessary so that the public gets an adequate buy in our State or whether or not the rates are redundant, inadequate or discriminating. There are certain truisms in this business, and they don't require a Federal agency to set them out.

Mr. SUTCLIFFE. I really wasn't suggesting a Federal agent was required to set them out. I was exploring whether or not a uniform no-fault auto insurance plan would enable—

Mr. BARGER. Statistical plan?

Mr. SUTCLIFFE. No, reform plan, insurance program—that the States absent Federal involvement would regulate, would enable the States to have cross-fertilization from one another. If someone experimented and found it would work, you would know it would work in another State because they were operating under the same plan.

Mr. BARGER. Yes, I understand what you are saying.

Mr. SUTCLIFFE. I am exploring. I am really asking—

Mr. BARGER. I have two inherent problems with that. No. 1, if you don't like it, how do you undo it, how do you unscramble the egg? That is No. 1.

No. 2, I am not sure that the needs in the State of Massachusetts are the same as the State of California. I have been told, for instance, one of the reasons for the initial success in Massachusetts, and I think I heard the testimony this morning by I think Mr. Stark, in glowing terms, was because there was a tremendous amount of frequency and severity of claims that had decreased since the advent of Massachusetts law. This was occasioned by the factor of mandatory insurance and other factors peculiar to the State of Massachusetts. They may not be peculiar to the State of California.

I mentioned Commissioner Preston. He is from the Commonwealth of Kentucky. With the exception of one major area, Jefferson County, which includes Louisville, it is primarily a rural-suburban State. I wouldn't suggest that the problems of the Commonwealth of Kentucky are in any way similar to the problems of Los Angeles.

Mr. SUTCLIFFE. Which problems?

Mr. BARGER. Classification, rating—

Mr. SUTCLIFFE. Regulatory problems?

Mr. BARGER. Regulatory problems. I am talking about the severity of injuries on freeways; I am talking about the kinds of damage in

des of transportation. You know, muscle cars and sports cars a-vis pickup trucks and trucks.

Mr. SUTCLIFFE. How does that indicate the type of reparations system you would design?

Mr. BARGER. Very simply this: When you are dealing with a public it is extremely mobile with a higher horsepower car and intensely overutilizing the freeways, I think we do sometimes have a greater severity of accidents than you would have on a rural road a pickup truck.

Mr. SUTCLIFFE. You have different rates?

Mr. BARGER. We have different rates. We also have a different system to reimburse the person injured.

Mr. SUTCLIFFE. Why, for a person injured in Kentucky or a person injured in California?

Mr. BARGER. Fine. Commissioner Preston may arrive at a point time in Kentucky where costwise he can justify a first party package; laid upon the third party system, with very little jockeying in the pain-and-suffering area, which will not cost the people of the Commonwealth of Kentucky very much because the frequency and severity of claims in the State of Kentucky may not be as severe as they are in the State of California.

I have already come to a conclusion that there is no way because of frequency and severity in California that I can make any savings by writing first-party coverage unless I cut down pain and suffering in smaller cases. It is that simple.

Mr. SUTCLIFFE. Of course, if you effect savings with that plan in California, Mr. Preston could effect savings, not just hold the line, with that plan in Kentucky.

Mr. BARGER. That is correct, but you also must remember this, that the Federal Congress notwithstanding, we are all creatures of politics.

Mr. SUTCLIFFE. The art of the possible?

Mr. BARGER. The art of the possible. Very nicely put.

Mr. SUTCLIFFE. Thank you very much for your testimony.

Mr. BARGER. Thank you once again for allowing me to speak.

Senator HART. Commissioner, you have been helpful.

Before you call our Secretary of State, I will send down to you the testimony he gave. I marked the section of his comments on the uninjured motorist.

(The statement follows:)

STATEMENT OF RICHARDS D. BARGER, INSURANCE COMMISSIONER OF THE STATE OF CALIFORNIA ON BEHALF OF THE NATIONAL ASSOCIATION OF INSURANCE COMMISSIONERS

My name is Richards D. Barger. Today I am appearing on behalf of the National Association of Insurance Commissioners, commonly referred to as the NAIC, both as the Insurance Commissioner of the State of California and as President of the NAIC. Having its inception in and regular meetings since 1871, the NAIC is the oldest voluntary association of state officials. It includes the principle insurance regulatory authorities of the 50 states, the District of Columbia, and the territories of the United States.

The proposed National No-Fault Motor Vehicle Act, as revised in Committee Print No. 1, poses two fundamental issues; (1) to what extent should the concept of fault be eliminated from the legal and automobile insurance system and how might it best be tested and implemented, and (2) if the system is changed, how should it be regulated?

On May 13, Commissioner Lorne R. Worthington, the past President of the NAIC, testified before this Committee on the original version of S. 945 which also posed these two basic issues in a somewhat different form. As to the issue of no fault, the NAIC recommends the experimentation on a state by state basis to resolve this complex and varying problem. The state by state approach provides a means to do so in a manner responsive to the public's choice in the marketplace between the benefits it wants at costs it's willing to pay.¹ The reasons for this conclusion are spelled out in Commissioner Worthington's statement and we will not repeat them here. Subsequently at the NAIC meeting June, the following resolution was adopted.

Whereas the auto reparation systems currently in force in the various states do not uniformly and adequately compensate all injured parties in auto accidents for their economic loss, and

Whereas such reparation systems often fail to provide prompt payments of insured losses, and

Whereas such reparation systems fail to equitably distribute the claims dollar among all victims and claimants, and

Whereas no-fault insurance is now available for medical payments, comprehensive, and collision coverages, and

Whereas the National Association of Insurance Commissioners feels keenly its responsibility to use its influence and expertise to meet the changing needs of society, now, therefore, be it

Resolved That the National Association of Insurance Commissioners recommends to the legislatures of the several states, which have not already enacted such legislation, enactment at a minimum of "modified no-fault" insurance coverages which provide coverage for economic losses suffered in auto accidents including the following:

(1) Prompt payment for economic loss;

(2) Distribution of the auto insurance claims dollar in such a manner that a close relationship is developed between the benefits delivered to each injured party and his actual economic loss;

(3) Distribution of a larger percentage of the premium dollar to parties suffering economic loss; and be it further

Resolved That the auto reparation systems continue to remain under state regulation and that there be no federal government implementation of any auto reparation system or federal alteration of the tort system; and be it further

Resolved That the NAIC continues to support and endorse state-by-state experimentation with various forms of no-fault coverages and the right of the states to enact systems with differing characteristics.

However, let me note that state insurance regulation has no vested interest in either eliminating or continuing the third party legal liability system for automobile insurance. We currently oversee both fault and no fault type coverages. What is ultimately in the best interest of the public is what we favor and support. The problem is determining what is ultimately in the public interest.

1. THE STATE INSURANCE REGULATORY MECHANISM

Today we shall concentrate on the second basic issue—i.e., how should the system, if changed, be regulated. As an essential backdrop let me briefly highlight the state insurance regulatory mechanism which is both broad and detailed. For example,

(1) Insurers must obtain and continue their licenses in order to do business. This, in turn, requires complying with statutes and regulations pertaining to formation, financial standards concerning assets, capital and surplus, permissible investments, adequacy of reserves, and qualifications as to character of management, experience and knowledge of the business. Licenses may be suspended or revoked for failure to comply with the law or when the public interest so requires.

(2) Insurers must file comprehensive annual and other periodic reports under oath in each state in which they do business. The NAIC annual statement re-

¹As the DOT study pointed out, the public is primarily concerned over the cost of automobile insurance. Testimony at the previous hearings on S. 945 raised serious questions as to the magnitude of cost increases attributable to increased benefits. Committee Print No. 1 further expands benefits available, so the issue of cost becomes even more critical.

quires detailed information concerning financial condition, underwriting, investments, reserves, etc.

(3) Insurers are subject to comprehensive periodic examinations to, among other things, ascertain the financial condition of the company, the results of operation, corporate investment and underwriting practices, whether the company is meeting its obligations to its policyholders, etc.

(4) By virtue of statutory standards on policy content and the commissioners' policy form approval or disapproval power, much of the source of misrepresentation or other unfair practices is deterred in advance.

(5) Control is exercised over the pricing practices of property and liability insurers by implementing either through prior approval or subsequent review the standards that rates shall not be excessive, inadequate nor unfairly discriminatory.

(6) Market practices are controlled by, among other things, laws governing the qualifications of agents and brokers, licensing of the same, prohibitions against certain practices such as false and misleading advertising and representations, defining standards of fair competition, control over policy forms, rate controls in several areas and department investigations of complaints.

(7) The insurance commissioner may, for a variety of causes, (e.g., insolvency, refusal to comply with orders, failure to remove officers, etc.), apply for a court order of liquidation, rehabilitation or conservation.

(8) Among the sanctions available for enforcement of the insurance laws are criminal and civil penalties; cease and desist orders; injunctions; removal of officers and directors; fines; and revocation of (or refusal to renew) licenses of agents, adjusters, brokers, and insurers. These express powers and sanctions, plus the informal powers, sanctions and alternative modes of relief stemming therefrom, extend far beyond what is being talked about in connection with the proposed federal bill.

Supplementing the efforts of the individual states has been the NAIC which is a 100 year old organization consisting of the insurance commissioners of the several states. The NAIC has sought to promote uniformity where appropriate, developed model laws and regulations for use in various states and conducted various types of studies and research projects. The NAIC, as a whole, meets twice a year. Various committees meet during the interim. In addition, a central research office has been established. Thus the NAIC provides a flexible and timely facility to develop and implement change. In short, the NAIC has served as a mechanism to improve regulation and has provided impetus for change.

2. PROPOSED FEDERAL REGULATORY POWERS: GOALS VERSUS MEANS

Committee Print No. 1 vests a wide range of regulatory powers in the Secretary. Several of these are listed in the footnote.² In evaluating such provisions, we think it is important to differentiate between the goals being sought and the techniques used to achieve such goals. Once the goals are delineated, we are in a better position to evaluate alternative approaches to achieve them. The primary insurance regulatory goals implicit in Committee Print No. 1 seem to be as follows:

(1) Policy provisions which are fair and equitable,³

(2) Development of meaningful cost information affording the public a reasonable opportunity to compare price and quality of the product,⁴ and,

² For example, the Secretary would be authorized to (1) define monthly earnings (Sec. 2(14)), (2) determine the manner of proof of insurance, (Sec. 4(a)(1)), (3) issue regulations as to lump payment discounts (Sec. 5(a)(3)), (4) approve policy terms, conditions, exclusions, deductibles, coverages and benefits which are fair and equitable and afford opportunity for cost comparison (Sec. 5(d)(1)), (5) issue regulations as to filing claims (Sec. 5(d)(2)), (6) issue regulations as to whether an application for coverage is accompanied by a reasonable portion of the premiums so as to preclude rejection (Sec. 5(g)(1)(A)(1)), (7) promulgate a uniform statistical plan for allocation and compilation of claims and loss experience data (Sec. 6(a)), (8) prescribe regulations to require a minimal number of standard uniform policy provisions, classes of risk and rating territories (Sec. 6(d)), (9) issue rules on insurers' submission of the actual rate or premium being charged for each class of risk in each rating territory within each coverage in Sec. 5 (Sec. 6(e)), (10) appoint a statistical agent (Sec. 6(f)), (11) determine the time and in what manner insurers' claim and loss experience and actual rates shall be made available to the public (Sec. 6(g)), (12) organize an assigned claims plan (Sec. 7(a)(1)), prescribe regulation as to self insurers' role in an assigned claims plan (Sec. 7(a)(3)), and (13) promulgate regulations he deems necessary to carry out the purposes of the Act (Sec. 10).

³ See Comm. Print No. 1 Sec. 5(d)(1)(B).

⁴ See *id.* Sections 5(d)(1)(B) and 6.

(3) Assurance that coverage availability extends to all meeting the eligibility requirements.⁵

If the no fault concept, as embodied in this bill is adopted, few if any would quarrel with these regulatory goals. However, questions are posed in evaluating the manner of their effectuation. (a) Do the techniques embodied in the statute seem reasonably calculated to achieve the goal? (b) If so, does it conflict with other objectives equally or more important? (c) Are there preferable alternatives? Let us briefly review each of these goals with these questions in mind.

(1) *Fair and Equitable Policy Provisions.*—Section 5(d)(1) vests in the Secretary approval power over policy terms, conditions, exclusions, deductibles, coverages and benefits if such are fair and equitable. The use of policy approval power is a time honored insurance regulatory technique to achieve this goal. In fact, it is standard practice in every state. Numerous individuals in the various state insurance departments, with a countless number of years of experience and expertise, receive and scrutinize insurance company policy forms before they can be issued to the public. Their purpose is to assure that the policies conform to applicable law (whether state or federal). Changes must also be approved. A pattern of policyholder complaints, if any, will lead to subsequent review and possible withdrawal of approval. In short, the same goal and technique already exists at the state level. State approval procedures will continue, even if a similar mechanism is adopted at the federal level, since each insurance department is charged with the responsibility of seeing that insurers comply with that state's requirements. Repeating the same goal in a federal statute and creating a federal approved procedure would seem to be needless duplication in terms of time, effort and the taxpayer dollars.

(2) *Price Information.*—Both Section 5(d)(1) and Section 6 seek to develop meaningful cost information to enable the public to compare company prices and claims and loss experience. This is sought through the establishment by the Secretary of a common uniform statistical plan for allocation and compilation of claims and loss experience to be followed by every insurer. To accomplish the purpose of the statistical plan, the Secretary would be authorized to prescribe uniform policy provisions, classes of risk and rating territories for each coverage (Sec. 6(d)). Sec. 5(d)(1) (approval power over policy terms discussed above) relates to limiting the variety of coverage available; its purpose is to give buyers a reasonable opportunity to compare the costs of various insurers as well as to assure fair and equitable policies. Each insurer will submit to the Secretary the actual rates it charges (Sec. 6(e)). The Secretary is then directed to make available to the general public a comparison of each insurer's "indicated rate" based solely on claims and loss experience and the actual rate being charged for each class of risk in each territory. The goal of providing increased meaningful price information to the public is a valuable one. But at the same time, the technique suggested to do so needs to be evaluated in terms of its impact on other objectives.

First, the establishment of uniform policy provisions, classifications, and rating territories will rigidify a system at a time when experimentation and innovation are most important. The elimination of the fault concept and the shift to an entirely first party non fault coverage will revolutionize the writing of automobile insurance. Policy forms and rating techniques will undergo substantial transformation. In any undertaking of this magnitude and complexity, no person or persons can reasonably be expected to "divine" the proper course. Yet the assumption of omniscience is implicit in the provision for establishing nationwide uniformity in policy provisions, classifications, rating territories, etc. What is needed is a period of trial and error—a shakedown period on a state by state basis—giving both the industry and the public the maximum opportunity to learn and select. Only in this manner is there a reasonable likelihood that the best techniques and approaches will emerge over the long run.

Second, if the states retain the regulatory power, the likelihood of improved regulation, as the proposed no fault system evolves, would be greatly enhanced. Change could then originate from any one of several sources whereas the national regulatory approach limits the initiative for change and improvement to one source—i.e. the federal government.

Third, if the fault concept is eliminated for automobile insurance, it can be anticipated that some, if not several, life and health insurance companies will

⁵ See *id.* at Section 7(d).

enter the field and compete for this business. Such a development offers intriguing possibilities and new thinking redounding to the benefit of the insurance-buying public. However, the imposition of a straitjacket of uniformity could seriously impair, if not derail, this promising development.

Fourth, the sponsors of S. 945, as well as many others, have endorsed the concept of expanded utilization of the mass marketing concept as a means to reduce the cost of automobile insurance. As is documented by the NAIC Central Office staff study on mass marketing (a copy of which was recently submitted to this Committee as a follow-up to Commissioner Worthington's testimony), significant momentum has and is continuing to develop in this area. As is the case in most marketing developments, insurers are feeling their way by experimenting with those type of programs, coverages and underwriting which they feel can appropriately be undertaken. However, if their freedom to experiment is frozen, this promising development conceivably could be arrested in its infancy, thereby eliminating possible cost savings to the insured from marketing efficiencies and/or employer contributions.

Five, Committee Print No. 1 does not purport (nor does the Staff Analysis suggest) that the bill would regulate rates. Yet for the purposes of a statistical plan, a federal regulatory agency would be vested with control over classification and rating territories, both fundamental elements in ratemaking. This would severely disrupt the existing regulatory pattern. Also it could result in federal establishment of national groupings which may be less relevant when applied to local situations.

Furthermore, the elaborate statistical scheme proposed in this bill—designed to provide meaningful cost information to the public—appears to be quite impractical. Remember, we are not dealing with a single national rate structure. Rates will vary by territories and their classifications. Under a competitive system rates are being constantly changed. Hundreds of companies write automobile insurance. To provide timely information on a multitude of insurers, each having a multitude of rates in an economic environment fostering frequent rate changes, presents a Herculean task. Publication of comparative rates and experience will most likely be out of date before the public has an opportunity to receive and absorb it. In other words, this scheme would not provide timely—i.e. meaningful—information. Some states have attempted to grapple with this problem and found it to be a difficult one to solve. The proposed scheme in the bill, in our judgment, over simplifies the problem. Thus, not only does the proposal conflict with other objectives embodied in the bill, it does not offer a practical solution to even achieve its stated goal.

In short, while we concur in the goal of improved cost information for the public, at the same time we submit that the techniques proposed—such as a uniform policy provisions, rating territories, classifications, etc.—would adversely impinge upon the long term sound development of the proposed non-fault automobile insurance program. That is, techniques embodied in Committee Print No. 1 would inhibit the flexibility necessary for a meaningful "shakedown" period, would lessen the likelihood of improved and responsive regulation as the system develops, could deter the influx of life and health insurance company involvement, might arrest the development of mass marketing, and would disrupt the state regulatory pattern.

(3) *Availability of Benefits.*—Section 7 authorizes the Secretary to organize an assigned claims bureau and assigned claims plan to enable each person (or his legal representative) sustaining injury or death to obtain the benefits prescribed by statute if no insurance benefits under a qualifying policy are applicable, identifiable, or payable due to an insurer's financial inability to perform. The assigned claims mechanism is proposed as a means to make available protection that would not otherwise be forthcoming.

Developing a mechanism to provide coverage in residual areas is not uncommon. State insurance regulators have substantial experience in this area. Assigned risk plans for automobile insurance exist in every state. Approximately half of states found it appropriate to institute FAIR Plans to provide property coverage in urban areas. Nearly all states have enacted guaranty fund legislation to protect insureds and claimants in the event an insurer becomes insolvent. The proposed assigned claims bureau is another variant on the same theme.

Some may question the assigned claims approach as being the best technique. In the development of the FAIR Plans, this concept was originally considered and then abandoned in favor of the pool concept of one type or another.

This is not to say that the assigned risk approach is wrong, but rather its superiority has not been proven to the point that it should be mandated for all states in all circumstances. Furthermore, because of state expertise and willingness to grapple with residual problems such as this, the responsibility for assuring the availability of residual coverage should be left with the states to be solved with the peculiar problem of each state in mind.

3. AN ALTERNATIVE REGULATORY APPROACH

In the above discussion we have attempted to differentiate between objectives and the means or techniques to achieve those objectives. The insurance regulatory objectives (as distinguished from the objective of reforming the automobile repair system on a non-fault basis) implicit in Committee Print No. 1 are threefold: (1) fair and equitable policies, (2) provision of meaningful cost information, and (3) assurance of availability of benefits to those so entitled. We concur in the objectives, we disagree as to the means proposed.

A fundamental factor in evaluating alternative means is one's view on the issue of state versus federal regulation. It is not our purpose today to delve into this debate in detail. We only note here that utilization of the state insurance regulatory mechanism possesses the advantage that it already exists with 50 state insurance departments having over 4500 employees and budgets in excess of \$50 million. Furthermore, state regulation is closer to the public and hence more responsive to policyholder demands. It facilitates experimentation since the gravity of a mistake is severely limited. It tends to be more responsive in the presence of the continuous threat of Congressional removal of its jurisdiction. And, it is consistent with the fundamental concept of decentralization of political power.

With this backdrop, the NAIC expresses serious concern over the creation of an institutional insurance regulatory framework in a federal agency. Such a framework at best will lead to duplication of effort, time and taxpayers' dollars, and at worst will, over the long run, undermine the effective and viable system of state insurance regulation. Furthermore, the insurance regulatory provisions are only incidental aspects and not an integral part of the Committee Print's proposed non-fault program.

As stated above, we believe that the enactment of the non-fault concept at the federal level would be inappropriate. However, if Congress decides to adopt a federal no-fault program in some form as a matter of national policy, we recommend that no existing insurance regulatory authority be vested in any federal agency. (This would require the deletion of such provisions as Sections 5(d) (1), 6 and 7.) The responsibility for insurance regulation should remain with the states. The insurance regulatory goals of the state insurance departments are consistent with those implicit in the statute (as discussed above). The states possess the expertise. The NAIC provides a facility and impetus for change and where appropriate, for uniformity. Thus it is logical and reasonable to expect the states to fulfill this responsibility. We submit that this approach is in the best interest of the insurance-buying public.

Senator HART. Our concluding witness, and I want to thank him for his patience with us, is the chairman of the Insurance Department of the School of Business Administration at Georgia State College. Atlanta, Dr. John W. Hall.

STATEMENT OF DR. JOHN W. HALL, CHAIRMAN, INSURANCE DEPARTMENT, SCHOOL OF BUSINESS ADMINISTRATION, GEORGIA STATE COLLEGE, ATLANTA, GA.

Dr. HALL. Mr. Chairman, it is a pleasure to be here. I have enjoyed listening to the comments, the questions, and the answers.

I have had the privilege of witnessing some of the testimony today. I wish that I could remember all of the questions that have been raised because at times I wanted to comment and was not able to do so.

A few stand out in my mind. Would it be all right if I made a few comments on some of the things I heard?

Senator HART. We would appreciate it very much.

Dr. HALL. First, Senator Baker was making reference to I believe it was the Spangenberg comments the other day which I did not hear. But he was referring to the fact that in foreign countries they have unlimited liability insurance benefits, liability insurance system, and that perhaps he was implying that the cost was lower there than in the United States.

Of course, I think we have to take into consideration the fact that the court of law system is considerably different in those countries. For instance, I do not believe that they have a contingent fee system. I do not believe that they have what we term in the United States the collateral source rule. Hence, collateral became important in the total cost of the system, and I believe that one of the important collateral sources in many European countries would be a system of nation health insurance. This would be private health insurance benefits.

All of these would alleviate considerably the cost of the tort law system and unlimited liability. I believe the record ought to state I believe this is true. We do not have those conditions in the United States.

When I was asked to testify on S. 945, we were not asked to speak about the question of state versus nation. Particularly, I did not feel that we were, but in listening to the comments today, I feel compelled to make a couple of remarks.

I understand thoroughly, I believe, and sympathize with the desire to have a nation system. I believe I would disagree with Commissioner Baker that when you are dealing with—I believe when you are dealing with a system of indemnification where you pay benefits based upon economic loss primarily and where rates are established by territory, given all these conditions, I think that a uniform law would have certain merit.

You could always ask why should consumers be treated differently in one jurisdiction than in another simply because they happen to live there.

I was interested in your remarks regarding the multistate cities. I have to comment on this, just a parenthetical comment, it has nothing to do with no-fault. But I think you are also asking when you ask about multistate cities whether or not our system of reparation of State and nations is really an appropriate system.

A logical question one might raise is perhaps, as we move to massive urban areas, maybe it ought to be city and Federal or city and Nation. You know the arguments better than I.

Senator HART. I am sure I do not know the arguments better than you. I certainly sense there is a developing school of thought that says that we have passed the point in time when we can continue to force ourselves to be accommodated by what initially was an artificial line and increasingly tends to multiply costs and enormously rusts the efficiency in the delivery of service.

Dr. HALL. I think I was referring to the changing balance of power, rural/urban, the feeling of some people I have heard just talking philosophically about the role of State governments and urban governments. I do not want to get into it.

I would like, though, to give you my own philosophical and pragmatic thinking on the question of State and Nation. I have just been offering comments previously.

I feel that while all of us are impatient and I favor some sort of a no-fault plan, I think if we look at the development of workmen's compensations and the number of years that that took that we have moved.

I think we have moved surprisingly fast. I think pragmatically I would have to state that my orders of priority would be, let's try to have the States do it. I think the problems of the multistate city can be solved reasonably.

I am not prepared to offer a solution. I have seen some suggested solutions. I have not analyzed these in detail. If the States are not able to do it, perhaps under some sort of Federal deadline, then I suppose we ought to move to Federal standards.

Then if that does not work, then a nation system. I am speaking philosophically, it is open to debate. I think this is what I would favor.

I have given a statement to you. I am not going to read that statement in its entirety.

Senator HART. Doctor, we will print it in full in the record.

Dr. HALL. I have read it over carefully this morning. I put it together last night. I noticed a few changes, and I would like to make certain some of those changes are placed in this.

Senator HARR. We will make sure through staff that the record copy contains those corrections.

Dr. HALL. I appreciate that. This statement is divided into two portions. This first portion I will not read into the record, but it deals with some of my reasons for supporting the concept of no-fault.

It really is based upon a concept of individual responsibility. I think my feelings is that no-fault is a device that encourages a very high type of individual responsibility, the responsibility of a person to take care of themselves economically rather than asking you and I do take care of him as a matter of charity because he is able to take care of himself.

I would offer comments or answer questions if those should arise. I would like to devote most of my remarks to the question of what system should be primary, a system of automobile no-fault insurance, or other collateral sources.

I think we all agree that any change from our present system should have as its objective the reduction or elimination of some of the waste and inefficiency that presently exists. Among the sources of inefficiency is benefit duplication.

There are many no-fault benefit sources for economic losses. Public health insurance might include death, income replacement, and/or medical care benefits available under social security including medicare and medicaid benefits, workman's compensation benefit systems, and State cash sickness plans.

Private health insurance plans include individually purchased and group health insurance benefit systems, group practice prepayment plans, and even the more specialized accident policies available from the private mechanism.

Many benefit systems have been omitted from this listing, but I think the point is made that unless benefits are coordinated, it will be possible for some persons to receive more than indemnification for economic loss while others may receive less. Persons who receive more than indemnification may be inclined to malingering or to overutilize our limited health care facilities: Both malingering and overutilization have an adverse impact upon cost. Further, to the extent that there is benefit duplication, there exists an overcharge for the financing of health care, an overcharge which is not economic when one considers the aggregate costs involved.

With regard to the automobile accidents, our goal should be to perfect a system under which all victims of automobile accidents are indemnified for real economic losses. We cannot perpetuate a system in which some are paid double and others are paid nothing. As benefit duplication is minimized, the aggregate cost of the combined economic loss benefit system is reduced because of savings in both loss costs and expenses. As costs are reduced, it becomes more nearly possible for insureds to pay for adequate coverage.

By virtually eliminating the tort remedy, Committee Print No. 1 of the National No-Fault Motor Vehicle Insurance Act effectively deals with one significant source of benefit duplication as regards automobile accidents—the so-called collateral source rule.

Further, the staff analysis of Committee Print No. 1 very wisely suggests that no-fault automobile insurance would be primary over all other private insurance benefits or plans unless such plans specifically provide that their benefits are to be primary to “qualifying no-fault policy benefits.”

The bill itself is far from clear, and seems to indicate that where other private insurance is not specific on the point duplication benefits could be and would be paid. Personally, it would be my hope that all other private benefit systems would recognize that no-fault automobile insurance should be primary.

Committee Print No. 1 further states that no-fault automobile insurance benefits should be excess over benefits provided by “public health insurance.” “Public health insurance” is not defined. Perhaps this should be made more specific.

It is my firm belief that it is in the interest of the consumer and the public in general that no-fault automobile insurance benefits should be primary over all other benefit systems, public or private. I would state this feeling even though the no-fault insurance benefits were provided by governmental insurers either exclusively or on a competitive basis with private industry.

The issue is not private insurance versus governmental insurance, although I strongly favor the private insurance mechanism, but rather, efficiency in the delivery of benefits, good political or public relations, the provision of specialized care for trauma, equity or fairness among insureds in setting rates for different benefit systems, and the accomplishment of important public policy objectives.

Because “public health insurance” is not defined in Committee Print No. 1, I will limit my remarks to “public health insurance” in the form of the “national health insurance” proposals.

Further, it is assumed that all national health care financing proposals will be funded by specific taxes on a defined wage base, rather

than through general revenue sources. That may be a big assumption, but I think you understand what I am speaking about.

For the most part, I believe my remarks are applicable to most other "public health insurance" systems, however defined.

It is my opinion that automobile insurance no-fault benefits should be primary over all other benefit systems for the following reasons:

First, I think that important public policy decisions or goals would be facilitated. The national health insurance proposals of which I am aware, together with the income replacement provisions under the Social Security Act, have two predominant public policy goals. There are many others.

One would be the provision of adequate economic loss benefits—death, income replacement and medical care—for all at a minimum of cost.

A second goal under national health insurance alone is the control over the delivery cost of medical care and the encouragement of improvement in medical care through the redirection and reorganization of the full medical care delivery system. Fragmentation and duplication in medical care should be reduced.

I think these are public policy goals; important public policy goals, and with regard to automobile legislation which has been proposed or enacted, I think there are certain other public policy goals which are important. Some have been established, some have been suggested.

One public policy goal with regard to automobile legislation has been the provision of reasonable adequate economic loss—death, income replacement, and medical care—benefits at a minimum of cost, the same goal for national health insurance and income replacement benefits.

Another goal of automobile legislation in general has been a reduction of the needless waste of human and property resources caused by automobile accidents through efforts at reducing both accident frequency and severity.

Another is the development of a sound system of mass transportation in order to (a) aid cities to become financially sound and politically stable, (b) create opportunities for ghetto residents to move up the economic ladder, and to become self-sufficient and economically responsible, and (c) reduce pollution of our air and landscape.

Note that there is a common public goal under both national health insurance proposals and automobile legislative proposals and programs. Both seek adequate economic loss benefits at a minimum cost. There is no conflict regarding this goal.

The proposed goal of national health insurance to redirect the health care delivery system is commendable. However, while no-fault automobile insurance may not specifically contribute to the redirection and redesign of our health care system, it is my opinion that it will not detract from it.

Trauma injuries of all types and causes—occupational and non-occupational, automobile and other accidents—constitute between 4 and 5 percent of the total care bill. Auto accidents alone account for only a part of the 4 or 5 percent—a relatively insignificant part of the total bill.

Except for the requirement of specially supervised care of trauma accidents, I suggest that the care of automobile accident victims will follow the patterns of health care nationally. It will not lead, nor will it obstruct the redevelopment and redirection of health care delivery systems.

It is my opinion that no-fault automobile insurance will be essentially neutral as regards this proposed public policy objective of national health insurance plans.

If this neutrality can be granted, then other public policy issues assume importance. Assuming that both benefit systems are relatively similar in efficiency, that system should be primary which tends to satisfy the greatest number of important public policy objectives.

In our economy, we operate under the so-called "economic man" concept under which relatively rational consumers make decisions among alternatives, consumer purchases and political decisions based upon their knowledge of needs and estimates of cost, a form of cost-benefit analysis. By internalizing the costs of automobile ownership, including the owner's share of the cost of economic losses suffered from automobile accidents, it becomes possible for the "economic man" to make reasonably rational economic decisions on important individual and public policy goals, such as—and these are individual goals or public policy goals—such as:

- (a) How many cars should a person own?
- (b) How should one vote on rapid transit issues?
- (c) Should a person commute by car, or is mass transportation desirable and less expensive?
- (d) What type or make of a car should be purchased from the viewpoint of both accident avoidance and protection in the event of an accident?

These are only a few examples of decisions influenced by the costs of automobile ownership.

Drivers and users of automobiles should bear the cost of automobile ownership and enjoyment. They should have to pay the cost of the benefit system. At the present time, much of the cost of caring for the automobile accident victim falls on society as a whole, either in taxes or charity contributions, or particular elements of that society, such as the family of the victim. These costs are hidden. I am suggesting that if national health proposals are made primary, the economic costs of automobile accidents would continue to be defused and hidden, but perhaps even to a greater degree.

Incidentally, the isolating of the costs of no-fault automobile insurance, and charging them to the driver-owner of vehicles, would facilitate the generation of sufficient statistical evidence regarding traffic accidents and their causes to maximize systematic approaches to traffic safety.

I think a second reason for establishing no-fault insurance as primary is just plain good public and political relationships.

From the viewpoint of the insurance purveyor, private or governmental, it is always best to pay benefits from that benefit system for which premium charges are closest to the consumer's pocketbook. Automobile no-fault benefits would be funded primarily from individual premium contributions, or from payroll deductions on an essentially auto owner pay all basis.

By contrast, workmen's compensation benefits are funded essentially on an employer pay all basis and social security income replacement and medicare benefits are now funded on employer-employee contributions.

Even group insurance premiums are often funded with employer contributions.

Thus, while it is difficult to know exactly the funding that would develop should National Helath Insurance become law, presumably wage base.

Where compulsory no-fault benefits funded by individuals are excess over benefit systems whose premium costs are more diffused, the driver-insured will not see sufficient tangible results of his contributions. He can make no realistic cost benefit analysis, and will damn the no-fault benefit system.

Where the employee or the driver is paying substantial premiums to a benefit system, he ought to see tangible benefits arriving from that system when a need arises.

It would be disastrous to the automobile no-fault system for owners to say: "I paid high premiums but received practically no benefits because those benefits were on an excess basis."

TRAUMA CARE SHOULD BE SPECIALIZED

Another argument for making automobile no-fault primary involves the question of whether or not there should be specialized care for trauma cases.

Perhaps a case could be made for the need to care for trauma victims on a specialized basis and not lost in the shuffle of general medicine.

Historically, insufficient attention has been given to the treatment of trauma cases. Little, if anything, has been done toward improving the emergency care of automobile accident victims and the facilitating of getting the victim to the hospital.

Rehabilitation of the accident victim, economic, social, and medical, has not gone forward as rapidly as it should.

Perhaps a good case could be made for the separation of trauma patients and the treating of them specifically.

Here, the expertise of the private insurance mechanism, especially as it relates to the rehabilitation of trauma cases under workmen's compensation, could make an important contribution to medical and economic recovery and also the ultimate reduction of the cost of no-fault automobile insurance.

In fact, the private enterprise motive for reducing costs should be a prime motivator toward rehabilitation.

Let us go to the question of no-fault benefits and program efficiency.

In the staff explanation of the committee draft, it was stated that public health insurance benefits should be primary because this would be more efficient.

I believe that perhaps no-fault automobile insurance on a primary basis can be delivered just as efficiently, and perhaps more efficiently, than delivering the same benefits under a proposed national health care system.

And in addition to encouraging the specialized care of trauma cases, which should encourage efficiency in the long run, other efficiency factors might be considered.

And often, when we talk about efficiency, we make comparisons, individual automobile insurance, individual insurance with group insurance or, individual insurance with our social security system.

In comparing the efficiency of group health insurance with automobile insurance, or the efficiency of a proposed national health insurance scheme with automobile insurance, it should be observed that all measures of efficiency are based upon averages.

Both group health insurance and the proposed national health insurance measures of efficiency must assume a general range of medical care needs, including those caused by trauma.

Automobile accidents take place in diverse places throughout the United States. Trauma cases require specialized care. This may tend to increase the administrative load of handling such claims.

Even where automobile benefits are funded under a proposed national health insurance scheme, nevertheless, the administrative costs associated with automobile benefits might well be higher than for other benefits covered by the plan. Stated differently, auto accident benefits coverage may reduce the efficiency of proposed national health insurance plans. It should make little difference on aggregate costs where these benefits are funded.

Again, talking about efficiency, in relation to comparative efficiency estimates, it should be observed that private no-fault automobile insurance most likely will be marketed on a mass or group basis, with all the efficiency associated with this form of merchandising.

It is not fair to compare the costs of marketing individual automobile insurance today with the cost of other forms of health insurance, private or governmental, and state that automobile insurance, as it exists today is relatively inefficient. Automobile insurance today is marketed on an individual, and not on a group basis.

No-fault automobile insurance is relatively limited as to covered causes of loss when compared to other forms of health care coverage. Benefits are payable only for injuries caused by the automobile.

By making "public health insurance" primary, and automobile benefits excess, admittedly the cost of no-fault automobile insurance will be reduced considerably. These reductions should be recognized in the premium, as required in the proposal.

However, the smaller the premium, the greater will be the expense of delivery of the benefits system in relation to the total premium.

Stated differently, there are a minimum of expenses associated with issuing of a policy or a certificate, or simply maintaining an open account, and the payment of claims.

The more limited the coverage under the contract, excess over public health insurance, the higher will be the expense of providing these services in relation to the premium. This does not lend itself to efficiency.

On the contrary, by making the no-fault benefit system primary, benefit costs in relation to premium will be higher, and the system will operate with greater efficiency. Benefits in relation to premium should be higher.

Another point with regard to efficiency, the proposed national no-fault automobile insurance plan provides economic loss benefits which are more liberal than those provided under most existing public health insurance plans. In my opinion, they are more liberal than those found under any national health insurance proposal likely to be enacted.

Thus, it is very likely that the excess no-fault system will be required to make payments of some sort. In other words, when no-fault benefits are excess over national health insurance, it seems likely to me that they will be required to make payments over national health insurance, especially in severe loss, necessitating the expense of claims and recordkeeping under multiple benefit systems. Simplicity of operation and efficiency would be fostered, in my opinion, by making the relatively liberal automobile no-fault insurance primary.

Finally, as indicated previously, internalizing the costs of economic losses associated to automobile accidents to the owner of automobiles should focus attention on these costs and thus contribute to pressure for safety and reduce, hopefully, total premium.

Let us talk about equity. I think from the viewpoint of price equity, it would appear that the public would benefit from making no-fault benefits primary.

Committee Print No. 1 requires that credit be given in the premiums for the existence of private or governmental public health insurance benefits.

The variability of both private and public health benefit programs as they relate to individuals creates very difficult rating situations, and it would be exceedingly difficult to establish equitable rate credits under the no-fault plan.

Certainly, it would be very difficult to establish equity through standardized deduction, which would create, in my opinion, great inequities.

There are no hard facts on any of the arguments which I have presented today. By the same token, there are no hard facts in opposition.

One could argue for more time for research. I think, as a matter of fact, issues in primary versus secondary do deserve further consideration.

So what are the alternatives from the legislative viewpoint? We could continue with the present committee draft, making public health insurance benefits primary.

Since we do not have a national health insurance program presently, this seems to be forcing us to make a decision without having adequate facts and without having the benefit of the needed research on this particular point.

Further, the present draft does not state clearly that automobile no-fault benefits should be primary over all other private benefit systems and that these other systems should be excess up to full indemnification.

Other alternatives might include the making of no-fault automobile insurance primary over all other benefit systems, public or private. Personally, I think I would prefer that.

Another alternative would be to make no-fault automobile insurance benefits primary over all other benefit systems, public or private, unless all other benefit systems specifically provide that they shall be primary over no-fault automobile insurance, and that no-fault automobile insurance shall be excess up to indemnification.

This latter alternative delays the decision as it relates to national health insurance until such a time as national health insurance is considered seriously by this Congress.

With regard to existing public health insurance programs or plans, since we cannot now describe a program of national health insurance, why make it primary at this time?

Perhaps workmen's compensation or the income replacement provisions of OASDNC, this second alternative would necessitate independent consideration of the relationship of the public plan to no-fault automobile insurance and to make decisions based upon the merits of each case.

Senator HART. Doctor, the point to which you addressed yourself from the text, primary, secondary, and so on, I think is going to be difficult for us to resolve.

Dr. HALL. I agree.

Senator HART. The way you have analyzed it, and balanced the competing claims is very helpful. I am not sure yet that I am willing to say yes to your suggestion, but along with the rest of us, we will be helped enormously to make the decision as a result of what you have told us.

Mr. Sutcliffe?

Mr. SUTCLIFFE. Dr. Hall, you have mentioned the economic man concept. One principle of the economic man theory concerns competition.

We seem to have competing values within the economic man theory working here, because to the extent you argue for the assignment of costs to the automobile accident environment, we may be on a primary basis—we may be taking away from the consumer the choice to determine his reparation source.

It may be that for some reason the automobile reparations mechanism cannot provide benefits in the health care area at an efficiency equal to that provided by some other public or private benefit source.

How can we guard that possibility or insure against the availability of choice without adopting a provision similar to the one in the committee print?

Dr. HALL. First, I am not sure that I would agree.

We say there may be other systems that may be more efficient, but we don't know.

But, let me make an observation. The committee print does not offer an alternative. It says that no-fault automobile insurance should be compulsory.

The alternative, sir, if I understand it, that you seem to be implying, is that we could buy these first-party benefits from other sources.

Mr. SUTCLIFFE. The alternative that it offers is, you must have a qualifying no-fault policy.

Dr. HALL. Right.

Mr. SUTCLIFFE. To the extent that benefits are primary over those benefits, either by contract, an individual choice, or because of a public health program, which I must admit is not up for final decision yet, that you will get a set-off for your auto insurance cost.

The reason that this was done was really, I think, at the suggestion of another witness from Consumer's Union who said right now the first-party auto insurance premiums are provided at a 70-percent effi-

ciency, 70 cents return on the dollar, whereas some private and public health insurance programs provide those same reparations, insurance dollars, at 90-percent efficiency.

To the extent that you have that disparity in efficiencies, you more than make up for what you would lose in public policy objectives by transferring the cost from the auto environment to another insurance—

Dr. HALL. I am not certain we can measure your public policy objectives and the costs saved in one as compared to what we would gain in another, and further, I believe there was testimony this morning indicating that the automobile insurance system will become much more efficient.

I think under our present liability insurance system, we are moving to make it more efficient. Perhaps 90 percent initially is a high objective. I think we are moving in that direction and moving rapidly, and certainly under a no-fault plan, we would approach 90 percent.

Mr. SUTCLIFFE. In other words, you don't think that disparity will be maintained?

Dr. HALL. I do not.

Mr. SUTCLIFFE. That competition within the auto insurance mechanism itself will assure efficiencies close enough so that we don't even have to be worried about that tradeoff potential?

Dr. HALL. That is my hope.

Mr. SUTCLIFFE. So that would mean there would be a significant reduction in acquisition cost?

Dr. HALL. That is correct, under mass merchandising, group merchandising.

Mr. SUTCLIFFE. And significant reduction in claims handling procedures?

Dr. HALL. I think that would be true under no-fault.

Mr. SUTCLIFFE. Under what kind of no-fault, pure no-fault?

Dr. HALL. That would make it, I think, more efficient, yes I am not sure it is pragmatic.

Mr. SUTCLIFFE. But the thrust of your argument goes to the other public policy benefits deriving from an assignment to the primary side.

For example, you would argue that the private insurance mechanism would have great incentives to begin providing better postcrash treatment in terms of ambulance facilities, trauma stations within metropolitan areas or high-accident frequency areas, is that a thrust that you think the private mechanism would undertake if, in fact, they were totally primary?

Dr. HALL. I think the private mechanism has demonstrated already an interest in rehabilitation, in the specialized care of trauma accidents in workmen's compensation with a motive to reduce costs.

I would think that that same motive would be effective under this system.

Mr. SUTCLIFFE. A parallel would be the Insurance Institute for Highway Safety's work for the insurance industry.

Dr. HALL. Partially.

Mr. SUTCLIFFE. As an indication that this would be so?

Dr. HALL. As a partial indication, yes.

Senator HART. We thank you very much for your willingness to think through with us, a tough aspect of this.

Dr. HART. Thank you.

(The statement follows:)

STATEMENT OF JOHN W. HALL, CHAIRMAN, INSURANCE, SCHOOL OF BUSINESS ADMINISTRATION, GEORGIA STATE COLLEGE, ATLANTA, GA.

My statement to this group will be relatively short. I am not here to debate in detail the merits of fault vs. no-fault automobile reparations systems. Each of you are better informed about the arguments than I. In my own mind, after studying much of the material and considering the operation of the present reparations system and the possibilities inherent for improvement under a no-fault system, I believe firmly that consumers will benefit from a compulsory no-fault benefit system designed to compensate all victims of automobile accidents for a significant portion of their economic losses. This is what S. 945, Committee Print One, accomplishes.

I would like to limit this statement to just two matters:

1. A brief statement of one of my reasons for supporting no-fault, a reason which is both different from, and similar to, many of the others that have been articulated in the past, and which supports convincingly many of the tenets of the current bill, and

2. A statement of my belief, and the reasons for my belief, that automobile no-fault benefits, whether funded privately or governmentally, should be primary over other benefit systems, private or governmental.

In both instances, I believe sincerely that I am speaking in the interest of the consumer and the public interest generally.

AUTOMOBILE NO-FAULT BENEFITS AND INDIVIDUAL RESPONSIBILITY

Each of us believes deeply in the concept of "individual responsibility." It has been charged frequently that no-fault automobile insurance contributes to the breakdown of our heritage of "individual responsibility." It is my opinion that the system reenforces the concept of "individual responsibility."

In our American heritage, we operate under a private enterprise democratic system. There are many characteristics of this system, two of which might include:

1. Individual should have the opportunity and responsibility to care for themselves and their families—to provide for their economic security needs.

2. In fulfilling this opportunity, persons should be rewarded reasonably in proportion to their productive contributions to society.

In a private enterprise democracy, to the extent that these characteristics or goals are not fulfilled, governments have intervened in an effort to assure their fulfillment as a matter of public policy. For example:

1. To the extent that persons are not able financially to care for themselves and their families, society as a whole, through some form of private charity or public welfare, shoulders the burden. The fact that individuals are unable to care for themselves constitutes a failure in the private enterprise democratic system which must be compensated by funds taken from all productive persons in society in the form of contributions or taxes. Care for the indigent involves a public policy decision made years ago as a modification of the concept of individual responsibility.

2. In keeping with the concept of individual responsibility, public policy dictates that individuals should be encouraged to make greater contributions to society with the hope of greater rewards in the form of society's bounty. These encouragements include the public policy decisions regarding equal opportunity regardless of race, sex, color, creed, or national origin, and the various programs designed to train and retrain individuals so that they might assume a more productive role in our economy. Again, this is a reenforcing of the basic concept that individuals, by seeking a reward for their contributions to society, are also striving to become financially responsible—for themselves and their families.

Individual responsibility in the economic sense of taking care of one's own needs and being self-sufficient, is a high level of individual responsibility. It has re-

ceived sanction and support in public policy decisions and programs by Congress and governments at all levels.

Today we are considering individual responsibility as it relates to decisions regarding the tort law automobile liability insurance system and the no-fault automobile insurance system.

Our tort law legal system is one of individual equity, individual rights, and individual responsibilities. In this system of equity and responsibilities, individuals who are relatively negligent may be held legally responsible (accountable) for their actions which directly cause harm to others. Liability insurance (which should be compulsory if the system is to function) provides financial responsibility (accountability) giving authority to the legal responsibility. This responsibility for damages caused to others is basic in our heritage. Nevertheless, it is my thesis that the concept of individual responsibility (accountability) to others, as it functions in practice in the automobile tort law system tends to too frequently negate the responsibility of individuals to care for themselves.

In this light, the basic questions which should be considered are:

1. Is the tort law-liability insurance system in practice, as opposed to theory, a system which furthers the concept of individual responsibility or accountability to others?

2. Assuming that the fault-liability insurance system does in practice contribute to individual responsibility, does the system tend to function in conflict with the individual responsibility concept that one should be able to care for the basic economic needs of himself and his family?

3. If there is a conflict, which is the higher level of individual responsibility? Which should be encouraged in preference to the other?

Regarding the first question, much has been stated about the idea that the tort law system, by making people legally responsible for the damages caused by their negligent acts, tends to make persons more responsible as drivers and thus contributes to safety. Stated differently, it is argued that the fear of legal responsibility is a deterrent to unsafe driving practices, to the improper maintenance or modification of vehicles, to the purchase of vehicles which have inherently high-hazard characteristics, or to the purchase of automobiles or makes of cars whose basic engineering design does not give drivers the greatest possible flexibility as a deterrent to an accident in an emergency situation.

Assuming that:

(1) Liability insurance is unavailable,

(2) Either (a) every driver is financially responsible or (b) Financial Responsibility Laws are enforced (or even enforceable) against financially irresponsible negligent drivers, depriving them of the right to drive, and

(3) Automobile accidents are reported uniformly throughout the United States, I would agree that the tort law system should encourage safety through driver accountability. The investigation of accidents and the direct confrontation between a plaintiff and a defendant, perhaps through their attorneys, would truly be a traumatic and expensive experience. If every driver with assets and income knew that he might lose his economic well-being through an automobile accident, he would tend to be more careful. If every driver knew that he might lose his driver's license and be unable to drive if he were not financially responsible for the accidents which he might cause, then the tort law system would serve as a strong deterrent to carelessness. As a matter of practice, these conditions do not exist. As a matter of practice, there are many unsafe drivers and unsafe vehicles on our highways, so many in fact that national programs to correct these defects have been or are being considered for implementation—programs which operate independently of the tort law system.

It is common knowledge that in many jurisdictions, the system for reporting automobile accidents is less than satisfactory; accidents are not reported. This has an unfavorable impact on the operation of the financial responsibility law (and the equitable operation of the various rating plans utilized by private insurers). The tort law system is not permitted to serve as a deterrent to unsafe driving practices through the threat of removal of the right to drive.

Further, where liability insurance finances the tort law system, the insured is the defendant in a case—the person who may be held legally and financially responsible. Where cases are settled through negotiation, in most instances, the insured defendant is never informed of the final outcome. He never knows for sure, at least not until the next premium due date, whether or not he was deemed to be legally responsible (and presumably accountable) under the rules

of the tort law system. In fact, because of the expense of carrying cases to long negotiation or trial, cases tend to be settled on expediency. Where a payment is made, there is a presumption of legal responsibility when, in fact, legal responsibility might not have existed as eventually determined by a jury after an adequate investigation of the facts of the case in relation to the relative strength and credibility of witnesses and attorneys. Even assuming that the insured-defendant is conscious of his legal accountability, the financial responsibility is not borne by him, but by the insurer and all drivers insured in the same company. Conceivably, the plaintiff-claimant may have contributed a portion of his own award in the form of a premium to the same insurer. In short, the deterrent pains of legal and financial accountability are diffused throughout the insuring society and are not felt by the individual in either a legal or financial sense. This dilutes considerably (perhaps eliminates) the effectiveness of the tort law system in its role of encouraging responsibility and safety.

Regarding the second question, if one assumes that the tort law-liability insurance system does, in practice, contribute to the concept of individual responsibility and accountability to others, I suggest that the system tends to function in conflict with the concept requiring that persons be responsible for their own basic economic needs and those of their families. Let me elaborate. Given the tort law system, *compulsory liability insurance* is necessary. Through liability insurance, each insured protects his assets and is able to pay others damage awards required under the tort law system. Each driver is reasonably assured that others have funded an award for him if he wins a case against them. The concept of "an eye for an eye" is a meaningless viewpoint if the eyes of the negligent are made of glass.

But is compulsory liability insurance in keeping with the times, especially with our present awareness and public policy concerns for the problems of the poor? Are the Financial Responsibility Laws, which tend to make liability insurance mandatory if one is to retain his driver's license in the event of an accident, appropriate today?

The automobile is an economic necessity for most. While some might say that people do and could get along without their "wheels," the necessity of an automobile is a political fact of life. Perhaps the automobile is even more necessary for the lower economic strata of our population if they are to ever achieve the next higher rung on the ladder of economic opportunity—even to become self-supporting. The mobility of labor within the community is economically important and our mass transportation systems are inadequate; real improvements are many years away.

Is it fair, socially equitable, or desirable, to say to the economically disadvantaged, that they must pay high premiums for compulsory liability insurance to pay you and me for our economic and non-economic losses in an automobile accident in which they are at fault? Without insurance, the poor have little to lose under the fault system. They tend to be judgment proof. Their real needs for liability insurance protection are few. Is it fair to say that in an accident, the poor must be able to take care of the more fortunate *and* their attorneys when they cannot even take care of themselves? When they are at fault, who pays for the damages and losses of the poor? We do, through charity or public welfare programs.

The more affluent buy liability insurance to care for their assets and income for under the fault system, they tend to be targets. Perhaps this is the price which they must pay for success! The more affluent also tend to have full social security coverage, private employee benefits and individual life and health insurance to care for their own. The more affluent tend to be able to care for their basic economic security needs.

In many instances, under the tort law compulsory liability insurance system, relatively affluent innocent parties tend to be asking relatively poor negligent parties to provide for them additional benefits. Doesn't this tort law-compulsory liability insurance system tend to compound society's inequities?

If we assume that all drivers must bear a cost equivalent to *compulsory liability insurance premiums*, would it not be more equitable for each driver (the poor and the rich) to use those same premium dollars to take care of his own family through relatively liberal no-fault *economic loss* benefits? If we are going to force each driver to buy coverage as a condition precedent to driving, isn't it better to force him to take care of himself, rather than you and me *and* the attorneys? Are not the relatively affluent better off *not* to have to fund relatively indigent drivers through charity and welfare for accidents where the

indigent are at fault and cannot afford to take care of themselves? Would not no-fault insurance be inherently more stable politically? And incidentally, wouldn't the relatively well-to-do be better off using the \$100, \$200, \$300 or even \$1,000 liability insurance premium to buy additional death, income replacement, or medical care benefits for their own families without having to trust to the vagaries of the fault system for their recoveries in the event they are involved in an accident? Why shouldn't the relatively wealthy have a tort exemption also? Why should they compensate the attorneys?

Does the tort law-compulsory liability insurance system tend to function in conflict with the individual responsibility concept that one should be able to care for the basic economic needs of himself and his family? In my opinion, it does.

The final question, "If there is conflict, which is the higher level of individual responsibility?" must be determined according to the philosophy of the individual. In my opinion, it is in the interest of each of us that the concept of individual responsibility for the basic economic needs of himself and his family is primary. The concept of accountability or responsibility to others must be secondary.

The answers to each of these three questions involve deep soul-searching. No fault automobile insurance solutions suggest a break with tradition—a break with the *status quo*. Such breaks are not easy.

If one can assume that the most important aspect of the concept of individual economic responsibility involves caring for the basic economic needs of an individual and his family, then the concept of no fault automobile insurance, as envisioned by the draft of the bill being considered before this Committee (and other proposals of this nature), furthers the interest of individual responsibility. As a condition precedent to the operation of the automobile, no-fault coverage must be purchased—coverage which provides benefits primarily to the members of the driver's family. Benefit levels would be sufficiently high and broad to indemnify nearly all individuals for true economic losses and to pay those individuals who suffer severe injury, far more than they would receive (on the average) under the present system, including the damages for economic loss and for intangible loss or pain and suffering. Persons desiring excess economic loss coverages because their economic loss potential is higher (income replacement) and those desiring coverage for pain and suffering, can purchase these coverages to the extent that they wish to do so. These optional coverages create no real inequities in relation to the present system. Persons choosing not to purchase them, would, on the average receive higher benefits under the mandatory coverage than under the present system. Persons desiring to pay for the options would get what they pay for.

Senator HART. For the record, let there be printed the resolution from the Assembly of Governmental Employees, in support of no-fault. This assembly represents over one-half million State, county, and municipal employees.

(The resolution follows:)

ASSEMBLY OF GOVERNMENTAL EMPLOYEES

RESOLUTION

Whereas, the present fault liability system for auto insurance has serious shortcomings in providing efficient coverage, adequate market capacity and equitable resources to accident victims, and

Whereas, a number of plans for significant reform of the auto insurance system have been proposed, and

Whereas, the most responsive of these plans calls for the abandonment of fault-finding prohibition of suit for damages and no recovery for unmeasurable losses, and

Whereas, the affiliates of the Assembly of Governmental Employees are concerned over the establishment of a more efficient and more economic system of auto insurance for their members and for the general public, now therefore be it

Resolved, that the Assembly of Governmental Employees encourage its affiliates to introduce or support in their state Legislatures a no-fault plan incorpo-

rating the above concepts and that the Board of Directors be instructed to take appropriate action in support of Federal legislation to accomplish these goals.

Senator HART. For the record, let there be printed a legislative fact sheet prepared by the Communication Workers of America, informing their membership about no-fault automobile insurance.

(The fact sheet follows:)

COMMUNICATION WORKERS OF AMERICA LEGISLATIVE FACT SHEET

NO-FAULT AUTO INSURANCE

No-fault auto insurance is a system devised to lower insurance premiums, give you your income for the time you cannot work because of accident injuries, cover your medical-hospital bills arising from the accident.

In theory, that is what we are buying now. But in practice, that is not what we are getting.

The problem is this—so many cases go to lawyers and to courts to decide who is at fault in an accident that the lawyers end up with a big share of the premium dollar and the injured person too often ends up with not enough to cover his injury.

No-fault eliminates this.

As its name implies, if an accident occurs, you are covered by your insurance company and the other car's occupants are covered by the insurance company carrying the insurance on the other car.

You do not go to a lawyer and to court to find out which person is at fault. Instead, your insurance company pays your salary for the time you cannot work, and pays your hospital-medical bills.

Massachusetts and Puerto Rico have passed laws putting limited no-fault or a variety of no-fault in effect, and very good results are reported. Massachusetts had limited no-fault and rates are down. Next year, they are expected to decrease again. Puerto Rico also has had considerably lower rates.

Lawyers' groups, who obviously are being cut out of a large source of their income, are fighting no-fault on several levels, but they are also fighting it with distortions that often are just plainly lies.

Firstly, they want auto liability legislation left up to the states, where lawyers and insurance men have strong control of the legislatures. No-fault has been brought up in many states, but it has been acted on by only a few, so leaving it up to the states is sending it to limbo. Also, American families travel extensively from state to state, and they should have the comfort of knowing that they are protected regardless of which state they may be driving through. And, some states passed frauds that take away protections from the purchaser under the guise of reforming auto insurance. In those states, unlike Massachusetts and Puerto Rico, premiums will stay high and insurance company profits will go up.

Secondly; through advertisements and in presentations before various groups, the anti-no-fault lobbies have tried (probably successfully) to instill fear in people, by telling them that no-fault will take away their right to go to court, and so deny people a chance to get compensation for their injuries. This is a wholesale distortion of no-fault. But with a Gallup Poll showing that 81 per cent. of the people don't understand no-fault concept, the lawyers' effort at distortion is easy. The poll also showed those people who do understand no-fault support it by a ratio of almost 4 to 1.

Finally, lawyers are saying that they don't want any law passed which will reduce an injured person's right to collect for their injuries. That sounds fine, but under the present, lawyer-dominated system, the more serious your injuries are, the less chance you have of collecting for them. A two-year long study of auto liability insurance shows that serious injury victims do not get what they are entitled to, and often have to wait years to collect anything.

According to the study, the average totally disabled person suffered a \$78,000 economic loss but got only \$12,556 in liability insurance compensation.

No-fault would change all that.

Every licensed driver would have to be covered, losses would be compensated without legal fees, and payment would be prompt.

The legislation involved is the Hart-Magnuson bill in the Senate, and the Moss-Eckhardt bill in the House.

Since the Senate bill, as of the time this fact sheet is being prepared, is a little closer to what the Communications Workers of America supports, the fact sheet will spell out the basic points in the Senate bill, S. 945.

Every owner of a car in the United States would be required to purchase a policy covering losses, while operating the car, to himself, other drivers, passengers, and to pedestrians injured by the car. This policy would also cover damage to any property by the car, such as a fence or house, but does not include damage to another moving vehicle. (Collision insurance protection for damage to vehicles will be discussed later in this fact sheet.)

Insurance companies would be required to sell the required insurance to every person who has a valid driver's license, and who pays the premium.

Each driver's own insurance company would be required to pay him, other drivers of the car, passengers in the car, or pedestrians injured by the car for all wages (after taxes) lost due to the injury, up to \$1,000 a month. Those who make more than \$1,000 a month, may purchase additional protection separately.

This section of the bill also states that an injured person whose earning ability is decreased because of the accident will receive compensation for the loss of future earning ability.

If an injury should result in a person's inability to do normal work, such as housework, the person would receive benefits to cover the costs of having the normal work done.

Insurance companies would be required to offer two additional coverages, including one that opponents of the bill frequently misrepresent. That is coverage for intangibles, such as pain and suffering or inconvenience arising from the accident, and loss of the ability to enjoy life.

These intangibles usually were the basis of court suits, because while loss of wages and medical-hospital bills are easily documented, pain and suffering aren't.

Under no-fault those individuals who want coverage only for loss of wages and medical bills could obtain it, and those who want the additional coverage for pain and suffering could get it without putting the extra burden on every other driver.

The other additional coverage which a person could purchase would be coverage above the limits set by the bill—such as coverage to protect you if you earn more than \$1,000 a month.

No-fault also makes a progressive move concerning coverage from other insurance. For instance, if national health insurance becomes law, eliminating medical-hospital bills for individuals, then your auto insurance premium would be reduced by the amount which involves these bills. The same situation would hold true if you have private insurance, such as Blue Cross-Blue Shield, and the Blue insurance was designated "primary" to no-fault benefits.

The provision ensures that you don't pay for the same thing twice, even though—in a union-negotiated health insurance program—you may be paying only part or even none of a health plan's premium.

For instance, if a union contract provided that the employer pays for all medical and hospital costs, then your auto insurance premium could be reduced from \$200 a year to \$150 (figures are only examples).

The bill makes a progressive move concerning disputes between a policy-holder and his insurance company, over some provision of the insurance policy. Under a no-fault policy the matter can be taken to court, but the fees for the policy-holder are paid by the insurance company. Suppose a person says he is unable to work, and the insurance company denies his claim. The person hires a lawyer and goes to court. Regardless of who wins, the company pays the attorney's fee, unless the person is shown to have a claim which is fraudulent.

The bill also makes a progressive move concerning rates. It provides that the federal government, together with the states, would establish a system of reporting claims and losses so that uniform risk categories can be set up. This information would also be available to the public, and you could then know how much of the premium dollar is being returned to the public and how much is going into operating the insurance company.

Those items make up the heart of no-fault, and represent a significant change in a system which operates for the benefit of lawyers involved in liability cases more than for premium payers.

It is part of a package of legislation, and the other bills would eliminate state laws which now prohibit the sale of group auto insurance, permit unions to bargain for group auto insurance payments as a benefit in the contract.

require the development of safer cars, and make employer contributions to auto insurance be treated the same as accident and health contributions under the tax laws.

But the major piece of legislation is the basic no-fault law—and its passage substantially as in Hart-Magnuson in the Senate and Moss-Eckhardt in the House would be a direct improvement in the lives of American workers.

Senator HART. Also, for the record a letter from the United States Automobile Association discussion section 5(d)(1) of Committee Print No. 1 of S. 945.

(The letter follows:)

UNITED STATES AUTOMOBILE ASSOCIATION,
October 7, 1971.

Re: S. 945—Section 5(d)(1).

HON. WARREN G. MAGNUSON,
U.S. Senator,
Old Senate Office Building,
Washington, D.C.

DEAR SENATOR MAGNUSON: One of the most significant bills presently being considered by the Senate Commerce Committee is S. 945 (Committee Print #1), which calls for the establishment of a national system of no-fault automobile insurance. As a major writer of automobile insurance, USAA is obviously deeply interested in the outcome of your deliberations in this area. However, it is not the purpose of this letter to expound upon our views on the no-fault concept. Your Committee has already received abundant testimony on that subject. Instead, I wish to draw your attention to the far reaching, and very harmful implications posed by one of the Bill's provisions which has not commanded the attention it deserves in the hearings held by the Committee. We have communicated our views on this matter to the staff of the Committee, and it is at their suggestion that I am writing this letter.

Section 5(d)(1) of S. 945 obviously represents an attempt to assure that the mandated no-fault coverages will be readily available to all members of the motoring public. It does so by providing that:

"Any application for a policy of insurance * * * may not be rejected by an insurer, nor shall such policy of insurance once issued, be canceled or refused renewal, by an insurer except for (A) suspension or revocation of the license of an owner or principal operator to operate a motor vehicle, or (B) failure to pay the premium for such policy after reasonable demand therefor * * *."

I fully recognize that the idea of permitting all motorists to obtain insurance from the company of their choice has considerable surface appeal. It is essential, however, that you look beneath the surface. If implemented, I am convinced that this requirement would prove to be:

Unfair—in that it could force a limited number of companies—and their policy-holders—to bear the brunt of financially subsidizing the high risk segment of the motoring population;

Unrealistic—in that it would impose this burden blindly, without any consideration of the physical ability of these companies to service all persons who apply, and;

Unnecessary—in that there are other, more equitable, methods of attaining the objective sought.

If I may, I would like to elaborate upon these allegations.

(1) *Equitable Distribution of High Risk Motorists*

For many years, Assigned Risk Plans have existed in every State for the purpose of providing automobile insurance to those persons who—because of their accident or conviction record, or other high risk characteristics—are unable to obtain coverage in the voluntary market. The development of these Plans by the insurance industry reflects its recognition and acceptance of the social obligation of making insurance available to this group of motorists. The fundamental principle underlying all of these Plans is that this social burden should be equitably distributed among all insurers. In other words, no company is compelled to insure more than its fair share of such persons. To do otherwise would seriously and artificially distort the competitive interrelationship existing between companies in their dealings in the voluntary market.

The importance of this concept of equitable distribution becomes manifestly evident when it is recognized that, in most jurisdictions, the rates insurers are permitted to charge assigned risks are insufficient to cover the losses and expenses generated by that group. As a result, these rates must ultimately be "subsidized" by charging those persons voluntarily insured higher premiums than would otherwise be necessary. In the case of USAA, for every \$1.00 of premium earned from our assigned risks in 1970, the pay-out was \$1.41. This represented an underwriting loss of \$2,843,000 to the USAA membership. The existence of this regulatory policy of enforced subsidization was recognized in the recent report entitled "A Study of Assigned Risk Plans," submitted to the DOT by the Federal Trade Commission. It states that:

"It is our opinion that it will probably always be essential that some form of subsidy exist * * *. Individuals in this market in many cases cannot afford the premiums necessary to make this business break even. It is a social cost which the voluntary market must continue to bear."

The enactment of Section 5(d) (1) in its present form would not only result in the abolition of assigned risk plans—it would completely discard the idea of equitably distributing the burden of insuring high risk motorists. It would cast each individual company in the role of a quasi-public utility, obligated: (1) to write all applicants regardless of their driving record or other risk characteristics, and; (2) to continue to insure them for life. Unlike the public utilities, however, insurers are given no assurance by S. 945 that they will be permitted by the States—which retain power over the rates that may be charged—to obtain adequate premiums from such persons. In fact, as I have already observed, virtually all of our past experience indicates that such rates will be inadequate and thus will have to be subsidized.

What can be expected to occur if legislation embodying this principle is adopted? Since motorists will be free to select any carrier, I believe that we will witness a massive movement of the present assigned risk population, and other marginal risks, toward those companies which traditionally have charge the lowest rates. This in turn, will mean that these companies—and, ultimately, the policyholders they represent—will bear a vastly disproportionate share of the financial burden of insuring the accident prone segment of the driving population. The primary beneficiaries of this development will be the higher cost insurers, and their policyholders, who will no longer be responsible for writing their fair share of such business. *In effect, then, a limited segment of the insured motoring population would be forced to bear the brunt of subsidizing the high risk group.*

S. 945 implicitly recognizes the fact that it may have sown the seeds of financial disaster for those insurers who will feel the full impact of the "accept all comers" provision. Thus, it provides that companies may be relieved from compliance with this requirement:

"If the domiciliary State supervisory authority of such insurer deems in writing that the solvency of such insurer would be impaired by the writing of additional policies of insurance."

Provision for relief only after an insurer reaches the brink of insolvency can hardly be said to be consoling either to its management, its policyholders or claimants.

(2) Problems of Physical Capacity

There is yet another reason why equitable distribution is both necessary and desirable from the public's standpoint. As it now stands, Section 5(d) (1) completely disregards the very important practical question of the physical ability of any given insurer adequately to service the enormous influx of applicants who might appear at its door. This problem would be particularly acute for smaller insurers with limited staff and facilities (e.g., claims investigators, computer resources, etc.). In effect, S. 945 would force a company to insure all such persons even in the face of its obvious inability to perform that task effectively. The result would be a deterioration in service to all policyholders. I fail to see how this state of affairs would be in the public interest.

(3) Impact Upon USAA

For almost fifty years, USAA has operated as a non-profit member-owned cooperative dedicated to providing reliable insurance coverage, at minimal cost, to officers in the military service. The Association was formed in 1922 by active duty officers, who themselves had experienced great difficulty in obtaining auto

insurance at a reasonable price. By serving the special insurance needs of military men since that time, we have grown to a point where we now have more than 750,000 member-policyholders. One example of the special problems encountered by officers is that of obtaining coverage regardless of where they are stationed. In recognition of this fact we now insure—at a financial loss, I might add—more than 30,000 officers stationed in Europe.

The rates which USAA charges are widely recognized to be among the lowest in the industry. These low rates are primarily attributable to the fact that we operate directly by mail, and thus avoid the payment of agents commissions. They are *not* a product of highly selective or restrictive underwriting practices. Virtually any officer can obtain insurance from the Association, as is evidenced by the fact that we accept in excess of 99.5% of all applicants, and cancel or non-renew an infinitesimal number of policies. These assertions are substantiated by the fact that, in two major surveys conducted by *Consumer Reports* magazine, have been found to be one of the nation's outstanding insurers from the standpoint of service to policyholders and claimants.

I want to emphasize that USAA does not object to insuring its *fair share* of the assigned risk population. We accept this as an obligation of doing business. Nor do we oppose improvements in these Plans designed to broaden the available coverages and increase their effectiveness. We do object, however, to the "accept all comers" concept embodied in S. 945 which—inadvertently, I think—would severely penalize USAA, and other specialized companies similarly situated, for the compilation of a record of service and savings to the consumer. This would be the result if we are forced to write every high risk applicant who might be attracted by our low rates. *In a word, we think we would be inundated.*

(4) Suggested Alternative Approaches .

I am deeply troubled by the fact that the concept embodies in Section 5(d) (1) has found its way into other Congressional no-fault proposals (i.e. H.R. 10222, S. 2322, H. 4994). I strongly suspect that this has occurred without a full realization of the consequences which would flow from the imposition of a requirement of this type. The fact of the matter is that other—far more workable—measures exist for assuring the availability of a market to all licensed drivers. In this regard, I would refer your attention to the discussion of alternative solutions to this problem contained in the reports recently prepared for DOT under the auspices of the Federal Trade Commission. I would note, with particular emphasis, that none of these proposals adopt the approach contained in S. 945. Each of them is founded upon the premise that the burden of insuring substandard risks should be equitably distributed among all insurers, either through improved assigned risk plans, or by a pooling mechanism.

In considering how Section 5(d) (1) might be revised, consideration should be given to the fact that S. 945 leaves within the hands of state regulatory authorities the authority to:

(a) regulate the rates insurers may charge for insurance, and:

(b) license drivers, and thus determine the nature and size of the group which insurers will be required to serve.

Thus, the states will retain the power to define the group which will have to be insured, and the rates which may be charged. Under these circumstances, it does not seem unreasonable to suggest that they should also be charged with the responsibility of seeing to it that an adequate market exists.

As you may be aware, the DOT has requested the National Conference of Commissioners on Uniform State Laws to prepare model no-fault legislation. One of the provisions contained in their draft proposal deals with the problem of assuring the availability of insurance to all licensed drivers. Borrowing in part from the language contained in the draft, the Commerce Committee may wish to give consideration to an amendment of Section 5(d) (1) along the following lines:

"The [commissioner] of insurance shall adopt and implement or approve and supervise a plan assuring that the coverage required by subsection (a) of this section will be conveniently and expeditiously offered, subject only to payment or provision for payment of the premium, to all applicants for such insurance who are required by this act to maintain such insurance and who are unable to conveniently obtain such insurance through ordinary methods at reasonable rates. The plan may be by assignment of applicants among insurers or by pooling or other joint insuring arrangement or by any other method which will

The importance of this concept of equitable distribution becomes manifestly evident when it is recognized that, in most jurisdictions, the rates insurers are permitted to charge assigned risks are insufficient to cover the losses and expenses generated by that group. As a result, these rates must ultimately be "subsidized" by charging those persons voluntarily insured higher premiums than would otherwise be necessary. In the case of USAA, for every \$1.00 of premium earned from our assigned risks in 1970, the pay-out was \$1.41. This represented an underwriting loss of \$2,843,000 to the USAA membership. The existence of this regulatory policy of enforced subsidization was recognized in the recent report entitled "A Study of Assigned Risk Plans," submitted to the DOT by the Federal Trade Commission. It states that:

"It is our opinion that it will probably always be essential that some form of subsidy exist * * *. Individuals in this market in many cases cannot afford the premiums necessary to make this business break even. It is a social cost which the voluntary market must continue to bear."

The enactment of Section 5(d) (1) in its present form would not only result in the abolition of assigned risk plans—it would completely discard the idea of equitably distributing the burden of insuring high risk motorists. It would cast each individual company in the role of a quasi-public utility, obligated: (1) to write all applicants regardless of their driving record or other risk characteristics, and; (2) to continue to insure them for life. One of the provisions contained in their draft proposal deals with the problem of assuring the availability of insurance to all licensed drivers. Borrowing in part from the language contained in the draft, the Commerce Committee may wish to give consideration to an amendment of Section 5(d) (1) along the following lines:

"The [commissioner] of insurance shall adopt and implement or approve and supervise a plan assuring that the coverage required by subsection (a) of this section will be conveniently and expeditiously offered, subject only to payment or provision for payment of the premium, to all applicants for such insurance who are required by this act to maintain such insurance and who are unable to conveniently obtain such insurance through ordinary methods at reasonable rates. The plan may be by assignment of applicants among insurers or by pooling or other joint insuring arrangement or by any other method which will

The importance of this concept of equitable distribution becomes manifestly evident when it is recognized that, in most jurisdictions, the rates insurers are permitted to charge assigned risks are insufficient to cover the losses and expenses generated by that group. As a result, these rates must ultimately be "subsidized" by charging those persons voluntarily insured higher premiums than would otherwise be necessary. In the case of USAA, for every \$1.00 of premium earned from our assigned risks in 1970, the pay-out was \$1.41. This represented an underwriting loss of \$2,843,000 to the USAA membership. The existence of this regulatory policy of enforced subsidization was recognized in the recent report entitled "A Study of Assigned Risk Plans," submitted to the DOT by the Federal Trade Commission. It states that:

"It is our opinion that it will probably always be essential that some form of subsidy exist * * *. Individuals in this market in many cases cannot afford the premiums necessary to make this business break even. It is a social cost which the voluntary market must continue to bear."

The enactment of Section 5(d) (1) in its present form would not only result in the abolition of assigned risk plans—it would completely discard the idea of equitably distributing the burden of insuring high risk motorists. It would cast each individual company in the role of a quasi-public utility, obligated: (1) to write all applicants regardless of their driving record or other risk characteristics, and; (2) to continue to insure them for life. Unlike the public utilities, however, insurers are given no assurance by S. 945 that they will be permitted by the States—which retain power over the rates that may be charged—to obtain adequate premiums from such persons. In fact, as I have already observed, virtually all of our past experience indicates that such rates will be inadequate and thus will have to be subsidized.

What can be expected to occur if legislation embodying this principle is adopted? Since motorists will be free to select any carrier, I believe that we will witness a massive movement of the present assigned risk population, and other marginal risks, toward those companies which traditionally have charge the lowest rates. This in turn, will mean that these companies—and, ultimately, the policyholders they represent—will bear a vastly disproportionate share of the financial burden of insuring the accident prone segment of the driving population. The primary beneficiaries of this development will be the higher cost insurers, and their policyholders, who will no longer be responsible for writing their fair share of such business. *In effect, then, a limited segment of the insured motoring population would be forced to bear the brunt of subsidizing the high risk group.*

S. 945 implicitly recognizes the fact that it may have sown the seeds of financial disaster for those insurers who will feel the full impact of the "accept all comers" provision. Thus, it provides that companies may be relieved from compliance with this requirement:

"if the domiciliary State supervisory authority of such insurer deems in writing that the solvency of such insurer would be impaired by the writing of additional policies of insurance."

Provision for relief only after an insurer reaches the brink of insolvency can hardly be said to be consoling either to its management, its policyholders or claimants.

(2) Problems of Physical Capacity

There is yet another reason why equitable distribution is both necessary and desirable from the public's standpoint. As it now stands, Section 5(d) (1) completely disregards the very important practical question of the physical ability of any given insurer adequately to service the enormous influx of applicants who might appear at its door. This problem would be particularly acute for smaller insurers with limited staff and facilities (e.g., claims investigators, computer resources, etc.). In effect, S. 945 would force a company to insure all such persons even in the face of its obvious inability to perform that task effectively. The result would be a deterioration in service to all policyholders. I fail to see how this state of affairs would be in the public interest.

(3) Impact Upon USAA

For almost fifty years, USAA has operated as a non-profit member-owned cooperative dedicated to providing reliable insurance coverage, at minimal cost, to officers in the military service. The Association was formed in 1922 by active duty officers, who themselves had experienced great difficulty in obtaining auto

insurance at a reasonable price. By serving the special insurance needs of military men since that time, we have grown to a point where we now have more than 750,000 member-policyholders. One example of the special problems encountered by officers is that of obtaining coverage regardless of where they are stationed. In recognition of this fact we now insure—at a financial loss, I might add—more than 80,000 officers stationed in Europe.

The rates which USAA charges are widely recognized to be among the lowest in the industry. These low rates are primarily attributable to the fact that we operate directly by mail, and thus avoid the payment of agents commissions. They are *not* a product of highly selective or restrictive underwriting practices. Virtually any officer can obtain insurance from the Association, as is evidenced by the fact that we accept in excess of 99.5% of all applicants, and cancel or non-renew an infinitesimal number of policies. These assertions are substantiated by the fact that, in two major surveys conducted by *Consumer Reports* magazine, have been found to be one of the nation's outstanding insurers from the standpoint of service to policyholders and claimants.

I want to emphasize that USAA does not object to insuring its *fair share* of the assigned risk population. We accept this as an obligation of doing business. Nor do we oppose improvements in these Plans designed to broaden the available coverages and increase their effectiveness. We do object, however, to the "accept all comers" concept embodied in S. 945 which—inadvertently, I think—would severely penalize USAA, and other specialized companies similarly situated, for the compilation of a record of service and savings to the consumer. This would be the result if we are forced to write every high risk applicant who might be attracted by our low rates. *In a word, we think we would be inundated.*

(4) Suggested Alternative Approaches

I am deeply troubled by the fact that the concept embodied in Section 5(d)(1) has found its way into other Congressional no-fault proposals (i.e. H.R. 10222, S. 2322, H. 4994). I strongly suspect that this has occurred without a full realization of the consequences which would flow from the imposition of a requirement of this type. The fact of the matter is that other—far more workable—measures exist for assuring the availability of a market to all licensed drivers. In this regard, I would refer your attention to the discussion of alternative solutions to this problem contained in the reports recently prepared for DOT under the auspices of the Federal Trade Commission. I would note, with particular emphasis, that none of these proposals adopt the approach contained in S. 945. Each of them is founded upon the premise that the burden of insuring standard risks should be equitably distributed among all insurers, either through improved assigned risk plans, or by a pooling mechanism.

In considering how Section 5(d)(1) might be revised, consideration should be given to the fact that S. 945 leaves within the hands of state regulatory authorities the authority to:

(a) regulate the rates insurers may charge for insurance, and:

(b) license drivers, and thus determine the nature and size of the group which insurers will be required to serve.

Thus, the states will retain the power to define the group which will have to be insured, and the rates which may be charged. Under these circumstances, it does not seem unreasonable to suggest that they should also be charged with the responsibility of seeing to it that an adequate market exists.

As you may be aware, the DOT has requested the National Conference of Commissioners on Uniform State Laws to prepare model no-fault legislation. One of the provisions contained in their draft proposal deals with the problem of assuring the availability of insurance to all licensed drivers. Borrowing in part from the language contained in the draft, the Commerce Committee may wish to give consideration to an amendment of Section 5(d)(1) along the following lines:

"The [commissioner] of insurance shall adopt and implement or approve and supervise a plan assuring that the coverage required by subsection (a) of this section will be conveniently and expeditiously offered, subject only to payment or provision for payment of the premium, to all applicants for such insurance who are required by this act to maintain such insurance and who are unable to conveniently obtain such insurance through ordinary methods at reasonable rates. The plan may be by assignment of applicants among insurers or by pooling or other joint insuring arrangement or by any other method which will

reasonably accomplish the purposes of this section, including any arrangement or undertaking by insurers that results in all applicants being conveniently afforded the insurance coverages on reasonable and not unfairly discriminatory terms through ordinary markets."

"All insurers authorized to transact or transacting the business of selling automobile insurance as defined by subsection (a) of this section in the state shall participate in such plan and the plan shall provide for the equitable apportionment among all insurers of the insurance coverages, or financial burdens thereof, provided to applicants under such plan and of the costs of operation of the plan." (Emphasis added.)

I want to emphasize that this proposal is merely intended to be illustrative of the type of approach which might be followed. We will be happy to work with the staff of the Commerce Committee in the development of appropriate statutory language.

I want to apologize for the length of this letter. However, the concept discussed is of such fundamental importance to USAA that I felt it essential that we communicate our views as fully as possible.

Sincerely,

ROBERT F. McDERMOTT,
Brigadier General, USAF-Retired, President.

Senator HART. A statement for the record by the president of the Washington State Labor Council, AFL-CIO, Mr. Joe Davis.

This statement was presented at the Insurance Commissioners Conference on Automobile Insurance Reform at the University of Washington on September 24 of this year.

(The statement follows:)

STATEMENT BY JOE DAVIS, PRESIDENT, WASHINGTON STATE LABOR COUNCIL,
AFL-CIO

We commend Insurance Commissioner Herrmann for calling this conference. No-fault automobile insurance is an idea whose time has arrived—with a vengeance. The question before us is not whether there should or should not be no-fault automobile insurance, but what form it should take. And we, like all of you, are groping. We welcome the opportunity to explore with other members of the community the concept of a new approach to the problems of the automobile insurance consumer. We have not come with a complete answer. Today, we will only talk about how we see the problem.

There seems little purpose in once more reviewing the problem as it exists today. It has been thoroughly documented that only about 40% of automobile insurance premiums are returned to victims of automobile accidents. Consumers, public officials and insurance industry spokesmen agree that the existing tort liability system is slow, costly and unfair. It should be obvious to even the most casual observer that the present public outcry for a new approach is symptomatic of the public's impatience with the present system.

Last year, Massachusetts enacted a no-fault auto insurance law representing the first completed step by any state away from the traditional tort liability system. A no-fault system has been in operation in Puerto Rico since 1969. Many other states have proceeded well beyond the talking stage. More than half are considering specific legislation or have instituted exploratory studies in the hopes of coming up with a system better suited to the public's demands and needs.

Herbert S. Denenberg, Pennsylvania Commissioner of Insurance, has termed the '70s the "decade of no-fault." He believes that there is no more obvious candidate for reform than our automobile insurance reparations system. Some knowledgeable observers, according to Denenberg, believe that a monkey with a typewriter could peck out a more rational system than the one we now have. We agree with Commissioner Denenberg that the system compensates too few, with too little, too late. Its processes are expensive and inefficient.

The labor movement, in Washington and the other 49 states, favors a national approach. We believe that allowing the states to enact their own separate no-fault automobile insurance programs will lead to the same hodge-podge of conflicting laws and unequal treatment which presently exists in the unemployment insurance and workmen's compensation programs. Automobiles are constantly crossing state lines and the potential for jurisdictional litigation is beyond belief.

We have discussed with Senator Magnuson and his staff the proposal he and Senator Hart have advanced. We think their approach is simple, direct and workable. We think that a uniform program administered at the federal level will assure equal and equitable treatment to all citizens of the United States. Despite the fact that Senator Magnuson's approach makes sense, there is no assurance it will be enacted by the Congress. There is a very real possibility that the Nixon Administration will continue to sidestep its responsibilities and urge that the State enact their own programs. So we expect to take part in developing a unique Washington approach. We want assurance that our State's no-fault automobile insurance law is an outstanding as our state workmen's compensation law.

We believe that certain minimum criteria must be met in a no-fault automobile insurance program.

1. There should be full coverage for all medical and hospital costs arising out of an automobile accident. Payment should be made by the insurer as costs are incurred. We should not ask those who are injured in automobile accidents to finance their own recovery. The average citizen does not have the immediate financial resources available to meet the high costs of medical care and hospitalization. Prompt and complete medical care can reduce many of the long-term costs of recovery and rehabilitation. Even if he knows that he will ultimately be fully reimbursed for his medical and hospital costs, the accident victim may hesitate to incur extraordinary expenses. Not getting necessary and desirable treatment in the short run, may well increase the long-run medical costs.

2. There should be at least 85% coverage for wage loss up to \$1,000 a month with optional coverage available for those with higher incomes. Payments should be periodic, at least semi-monthly. Family living expenses continue even while the wage-earner is unable to work. Money is needed, on a regular basis, to meet continuing expenses. It would be desirable in those cases requiring hospitalization to have an immediate payment equivalent to a week's earnings just to take care of the extra-ordinary, out-of-pocket expenses that occur when a member of a family suddenly goes to a hospital—the taxis, telephone calls, flowers and other innumerable costs—small and large—that create an immediate cash drain. Additionally, some mechanism must be created to adjust periodic payments for those who are unable to return to work for an extended period of time. Inflation has taken its toll in the past and we see no indication that it will not continue to do the same in the future.

3. There should be coverage for loss of personal services when the accident victim is not a wage-earner but a person upon whom others are dependent for their care. This means, primarily, mothers caring for small children.

4. There should be a mandatory schedule of awards, based on income, for permanent, partial disabilities. Monthly income should be multiplied by some factor which relates the disability to total disability. A system of awards, based on family income, should be developed for non-wage-earning accident victims.

5. Economic loss due to property damage should be fully compensated. Property damage coverage should include non-vehicle coverage and damage to nondriven or parked automobiles. There should be additional coverage available on an optional basis, above the minimum amounts provided in the statute. Damage to the automobiles of the insured should also be included, with appropriate deductibles.

6. It is necessary for a no-fault system to provide the opportunity for a pedestrian or passenger who is not a member of the car-owning family to recover general damages, in addition to recovery for economic loss. Minimum coverage should be provided by the no-fault system and additional coverage should be available for those who desire additional insurance protection.

7. Rehabilitation of accident victims should be a major consideration and goal.

8. A system of arbitration should be available for resolution of differences between policyholders and the insurer.

9. Finally, automobile insurance should be the primary insurance coverage, unless another type of policy, such as accident and health, stipulates that it will be the primary source of recovery.

Our insurance system is, at best, chaotic and it will be difficult to coordinate no-fault benefits with other insurance programs. The automobile accident victim may be eligible for benefits from individual and group insurance or a variety of negotiated fringe benefits. The victim may be covered by other forms of social insurance, such as workmen's compensation or social security. A primary issue will be whether there should be duplication of benefits or, if not, which program should be primary. We do not agree that there should be only one source of re-

covery. If duplicate benefits are denied, many persons will not receive insurance benefits for which they have paid.

If duplicate recovery is not to be allowed, the automobile insurance premium must be reduced to reflect the fact that a part of the risk is being taken by someone other than the insurer. Negotiated fringe benefits are paid for by reduced wages. If we deny an employee the right to collect the benefits obtained by foregoing a wage increase, he has given up something for nothing. Collective bargaining is a perilous procedure at best and no-fault insurance should not become an additional obstacle on the road to stable labor management relations.

Perhaps the question raised by this point is whether or not the entire insurance concept is so socially important that it would be best to make it a function of government. Perhaps insurance should be more closely regulated and its benefits more closely coordinated. The duplications of coverage in some instances, and the total absence of coverage in others, argue strongly for some method of benefit coordination. The individual consumer obviously cannot coordinate benefits. He has a difficult enough time simply trying to understand the primary coverages he has. But this, however, is another problem for another time. We raise it here only to emphasize a particularly difficult problem in the area of no-fault insurance.

Much has been said in praise of the no-fault approach as a means of reducing automobile insurance costs. We share the hope that a more efficient method of settling claims and eliminating procedural delays will lead to lower premiums. But we do not believe that "cheap insurance" should be the primary goal of a no-fault system.

Whether consumers regard automobile insurance as expensive depends on many factors. Primarily, the consumer will judge the cost by what he gets in return. A \$200 automobile insurance premium which requires endless delays before settlement of claims and which ultimately returns only about a third of the premium dollar in benefits is costly. The same amount of premium for a policy which assures the policyholder that he will be compensated adequately and immediately if he has an accident may be well worth the cost.

Automobile insurance costs will not be reduced solely by changing to a no-fault system. Automobile insurance payments include such items as medical costs and automobile repairs. No-fault insurance will not reduce hospital costs. It will not produce automobiles which will be easier and less expensive to repair. It will not, by itself, make automobiles safer, nor will it reduce the possibility of bodily injury because of poorly designed automobile interiors. But it does offer some hope.

Under the present tort liability system, the insurer pays for property damage sustained by others. There is no way of predicting what kind of automobile the policyholder will become involved with in an accident. No-fault, first party insurance will give the insurer the knowledge of the type of automobile damage for which he must provide. Premiums can vary depending on the type of automobile the policyholder owns. "Safe design" credits can be established, thus encouraging the policyholder, and ultimately the manufacturer, to provide a safer automobile, one that does not crumple the whole front end with a five-mile-an-hour collision.

No-fault automobile insurance will encompass the entire range of problems inherent in the workmen's compensation system. The concepts of no-fault auto insurance and workmen's compensation are identical in many respects. Let me take a few seconds to read something to you.

"The common law system governing the remedy of workmen for work-related injuries is inconsistent with modern industrial conditions. In practice it proves to be economically unwise and unfair. Its administration has produced the result that little of the cost of the employer has reached the workman and that little only at large expense to the public. The remedy of the workman has been uncertain, slow and inadequate. Injuries that were formerly occasional have become frequent and inevitable."

That, as I am sure you recognize, is the preamble to the workmen's compensation law in the State of Washington. You need only substitute "automobile driver" for "workman" and "insurer" for "employers" and you have an appropriate description of the problems that exist today with automobile insurance. The remedies for those injured in an automobile accident are unsure and uncertain. Little of the premium cost reaches those injured. We could do a lot worse than simply substitute "automobile owner or passenger" every place where

"workman" appears in our workmen's compensation law and "insurer" every place where "employer" appears. We would have a tremendous improvement in automobile insurance and a basically workable document.

The facts seem to us to argue very strongly for a state fund approach to no-fault automobile insurance. We believe that a non-profit state fund should provide basic coverage for everyone. Insurance companies should be allowed to compete for any additional coverage which automobile owners may wish to provide.

The average workmen's compensation program run by private insurance returns only about 65% of the premium dollar in benefits to the injured workman. The state workmen's compensation program consistently pays more in benefits than it collects in premiums. This has been true even during the years that premiums have been abnormally high to correct a reserve deficiency which occurred in the early 1960s.

We want the most efficient automobile insurance system at the lowest possible cost. The answer seems obvious to us. You can't argue with success and the state's workmen's compensation fund has been eminently successful.

A no-fault automobile insurance system must include an appeals board to resolve disputes on cancellations, reclassifications, or slow settlements, whether or not a state fund approach is used. There will be disputes about how much medical care is necessary. There will be disagreements as to when is the victim ready to return to work; what is the extent of disability. The Industrial Insurance Appeals Board has shown that such a system can work successfully. Of the 2,800 cases which are filed with the board each year, only 200 eventually end up with either party going to court.

The Insurance Commissioner should have a Consumer Fraud Division to investigate frauds by claimants, doctors, hospitals and repair agencies. The present Washington State law does not give the Insurance Commissioner any consumer protection authority for individuals. He can only help the general public by means of rate control. The Commissioner can enforce policy provisions for an individual but he can do little if a company refuses to issue a policy or arbitrarily cancels a policy. The consumer needs protection. The Insurance Commissioner is the obvious person to provide the protection.

The insurance companies of Washington have advanced their own proposal, and, as usual, it contains the insurance industry kicker. In return for accepting the inevitable—no-fault insurance—the companies want to remove the Commissioner's right of prior approval of insurance rates. We believe existing protections for consumers are essential, and we will strongly resist any attempt to change the present method of prior approval of insurance rates.

If private insurance companies are to be allowed to invade the no-fault field, rates must be supervised by the Insurance Commissioner. He should have the right to review all rates prior to their being placed into effect. It should be the responsibility of the insurance companies to justify their rates when the Commissioner believes them to be either excessive or inadequate. We will not accept any proposal which would shift the burden of proof to disprove the adequacy or excessiveness of rates to the Insurance Commissioner.

We believe that no-fault automobile insurance coverage should be mandatory, based upon either the licensing of the automobile or licensing of the driver—or perhaps a combination of both. Other states are investigating other approaches.

Obviously, any no-fault insurance system should provide protection against the uninsured driver. An approach similar to that taken by Senator Magnuson in his bill seems to us to be a workable solution. An assigned claims plan, which would be financed by an assessment on insurance companies, including the state fund, doing business in the state on the basis of their premium volume, should provide sufficient funds.

No-fault insurance policies should be noncancellable, except for the loss of license. The assigned claims assessment should be large enough to provide for those who have defaulted on their premiums. The state fund and insurance companies should be allowed a reasonable right of recovery against those who have defaulted.

A question which must be considered is how to integrate no-fault insurance with another idea whose time has come—national health insurance. If national health insurance covers all medical costs, then obviously such coverage will not have to be included in automobile insurance policies. If the national health insurance excludes automobile injuries, then we have a different problem. However,

we do not intend to allow the no-fault insurance question to hang up until the national health insurance problem is solved. If there are overlapping coverages in the two programs, they can be resolved when both programs have become reality.

These are some of the ideas we have and a few of the problems we foresee. The first serious no-fault proposal was made in 1932. Now, 39 years later, it is time to act.

ADDITIONAL COMMENTS—NO-FAULT SPEECH

Last week-end, I was in Colorado for the purpose of introducing Senator Jackson to the Colorado AFL-CIO Convention. They have an interesting proposal. The Colorado AFL-CIO is urging that a no-fault insurance program be enacted, funded by the gas tax. Several other states are also investigating this approach. This proposal has several very appealing aspects.

It would do away with the need for collecting premiums, significantly reducing administrative costs. Insurance agents' commissions are a major insurance cost item and funding by way of the gas tax would eliminate this expense. Funding the no-fault insurance program with a tax on gasoline obviously takes care of the uninsured driver. You pay your premium when you fill 'er up.

Use of the gasoline tax as the premium source would better relate risk and premium. The major exposure is the number of miles driven and the correlation between mileage and gas use is close. Obviously, we are not going to get a perfect match between risk and premium under any of the systems proposed, but the gas tax should give us the best possible correlation.

Funding through the gas tax would solve the problem of arbitrary policy cancellation by insurance companies. It would also protect the insured against excessive and discriminatory premiums.

Most of the no-fault proposals look upon insurance premiums as a policing function. These proposals imply that penalizing of bad drivers and getting them off the road is a function of the insurance premium. We do not look at it that way. Policing bad drivers is the responsibility of the State Patrol and other government agencies. It is the courts and the Patrol who should get the bad drivers off the road, not the insurance system.

Senator HARR. A map and table for the record indicating the numerous metropolitan areas in this country that overlap two or more States, and present the difficulties which the able Senator from Illinois, Mr. Stevenson, yesterday discussed with us, relative to the District of Columbia no-fault program absent a similar no-fault reform in Maryland and Virginia.

(The table and map follow:)

U.S. metropolitan areas¹ encompassing two or more States in 1970

Senator HART. An article for the record from the *United States Investor*, September 27, 1971, entitled "States Making Out a First-Class Case for Federal No-Fault Insurance Legislation."
(The article follows:)

[From the *United States Investor*, September 27, 1971]

KEEPING UP TO DATE ON . . . INSURANCE—STATES MAKING OUT A FIRST-CLASS CASE FOR FEDERAL NO-FAULT INSURANCE LEGISLATION!

DELAYS, INACTION, SHAM STUDIES AND PASSAGE OF PSEUDO LAWS RAISE QUESTION OF SINCERITY OF PURPOSE TO PASS TRUE NO-FAULT MEASURES

In addressing the American Bar Association recently, Secretary John Volpe of the Department of Transportation said: "The merits of the no-fault insurance concept are persuasive. So persuasive, in fact, that deliberations in Washington today relate primarily to the matter of where reforms should take place, at the state or the Federal level."

The same theme was adopted by George Crawford, the White House insurance expert, when he said, after seeing proposed no-fault legislation talked to death by lobbyists and others in Colorado: "We have come out for reform of a system we think needs reform. We think the states ought to be given a chance to reform themselves. If they don't do it within a reasonable time, we would want to rethink our position, about leaving it up to state discretion."

From all indications, these messages have not gotten through to the states. Or if they have, they have been drowned out by the outcry raised against such legislation by certain segments of the legal profession, particularly the American Trial Lawyers Association, the members of which have a considerable stake in preserving the present tort system inviolate. At any rate, the record of performance to date on no-fault legislation at the state level is far from impressive—leaving us to question the sincerity of purpose among the states to meet the mandate from Washington for forthright action on the no-fault concept within two years—or else!

"STUDY" LAWS—A FRAUD

Within the past several months no-fault bills have been introduced into the legislatures of some 33 states. Included in the group are bills calling for only token degrees of no-fault—and some, also, calling for "study" which, of course, means that they were destined to die a quiet death in committee. Among the states having such laws are New Jersey, Montana, Hawaii, Idaho, New Mexico, Maine, North Dakota, Texas and Tennessee.

In other states the merciful death of no-fault legislation was accomplished, but in various and diverse manners. Take, for instance, Connecticut, which has long been known for its progressive insurance legislation. In that state, William R. Cotter, now a member of Congress, ran head on into the trial lawyers group when, as insurance commissioner, he tried to get a modified no-fault plan of his

own making through the legislature. His bill which was designed to save 15 per cent in the cost of insurance was referred to the Judiciary Committee of the General Assembly where it had no better chance than a sheep in a packing house—for the simple reason that 32 of the 34 members of the committee were lawyers. Of particular significance is the fact that even though the bill had the editorial support of the major newspapers in the state, the committee refused to report it out—a situation which is not difficult to understand when it is recalled that among other things the bill had a provision calling for a reduction in contingency fees of lawyers to 25 per cent of the settlement figure.

But proposed no-fault legislation proved to be a hardy perennial in Connecticut. A bill was again filed this year and came to no better end. This time sheer pressure from the public forced it out of the committee, but members compromised on a "study"—which Cotter aptly described as a mere "stall." And even that bill didn't pass!

It is no wonder, therefore, that we find in Congressman Cotter today one of the staunchest supporters of action at the Federal level on no-fault insurance. His prediction is that most of the states will not meet the two-year deadline for action at the state level because of the powerful opposition from the legal fraternity and certain groups of agents. As a matter of fact, he seems to believe that Federal legislation should be passed *now* to become effective only where states have not acted within a reasonable time.

THE KISS OF DEATH

A similar situation has been witnessed in Maryland where a no-fault bill was sidetracked into Judiciary Committee—even though every other insurance bill introduced during the session was assigned to the Economics Matters Committee which has an insurance subcommittee. The outcome was no surprise—what with 21 of the 23 members of the Judiciary Committee being members of the legal profession. The committee gave the bill the kiss of death by making an unfavorable report.

In New York, certain segments of the legal profession are credited with more subtle strategy in getting rid of Governor Rockefeller's bill which came nearer to being a "pure" no-fault bill than any of the bills offered to date in other states—it being the handiwork of Richard E. Stewart during his term as insurance superintendent of the Empire State. The Senate Committee considering the no-fault measure got nowhere after finding itself the subject of a heated inquisition from its own special counsel. And to make matters worse, so many bills were introduced into the legislature that the legislators and the public alike became confused. All with the result that no action was taken on no-fault legislation, the sponsors of the original bill refusing to enter a compromise which would adulterate or water down the no-fault concept around which their proposed legislation was framed.

WHY NO-FAULT?

On the question as to what constitutes a "true" or "pure" no-fault bill it should be kept in mind that the more limited the right to sue under such legislation, the nearer it comes to meeting the basic concept of no-fault first party insurance coverage. And this, for two reasons. In the first place, there is that matter of reduction in legal fees, adjustment expenses and court costs which should result under such method of operation. On this score, there is no dearth of figures to show that the present automobile insurance system is both costly and wasteful. Under the Puerto Rico no-fault system (which, incidentally, has been in existence for about 20 months and is operated by the government), it has been found that 90 cents out of every premium dollar is available for benefits. And this is just twice the amount available in states having the "fault" system.

Looking at this problem another way, trial lawyers received under the tort system in 1970 \$1 billion and defense lawyers \$300 million out of the \$4.2 billion insurers paid to cover the \$6.8 billion of auto accident victim loss. Also interesting is the fact that in 1968 parties to automobile accident litigation spent \$600 million in legal fees which was equivalent to one-fifth of the legal profession's income. There is no reason to believe that this situation has improved since that time. Quite the contrary!

PRESENT SYSTEM UNJUST AND INEQUITABLE

In addition to being costly and wasteful, the charge is also made that the present system has proved in all too many cases to be unjust and inequitable—

with too many seriously injured accident victims going uncompensated and too many dependents of persons killed in automobile accidents receiving little, if any, benefits. Summarizing this line of argument against the perpetuation of the present auto insurance system wherein suits—warranted and unwarranted—play such an important role, the studies conducted by the Department of Transportation revealed that seriously injured automobile accident victims in the less than \$10,000 income bracket recovered only 46 per cent of their personal and family economic loss. The inequity of this situation becomes all the more apparent when it is pointed out that three-fifths of the families in this country fall within the less than \$10,000 income category. And what's more, this important segment of our population comprised over four-fifths of all the automobile accident victims during the year under study. Another interesting aspect of this study is found in the statement that those auto accident victims who completed the eighth grade recovered 23 per cent of their loss, while those with college training recovered 64 per cent.

The second reason for all this agitation among the public for no-fault insurance is directly related to the first and is quite as compelling, focused, as it is, on the crying need for a reduction in the ever-mounting cost of automobile insurance to the driving public. It comes right down to the fact that where suits are unlimited—as they are under the present tort liability system—automobile owners are obliged to carry high limits in coverages or face the possibility of bankruptcy if an injured motorist or pedestrian should sue them and be awarded a sum beyond the means of the average person to pay.

OVERPAYMENT OF SMALL CLAIMS

There is another important aspect of the influence of no-fault insurance on the cost of automobile liability coverage. It is quite generally conceded that the tendency of companies operating under the present tort liability system has been to overpay small claims merely to get them out of the way. In Massachusetts—which, under the old system (prior to the adoption of no-fault legislation effective January 1, last), had the questionable distinction of promulgating the highest automobile insurance rates in the country—the custom had grown up among policyholders to claim bodily injury as a mean of assuring prompt payment of property damage losses. In about 80 per cent of all such cases, Massachusetts plaintiffs would retain lawyers. In other states, lawyers have been retained in about 50 per cent of such small claims.

So convinced were the framers of the Massachusetts no-fault law that the elimination of this problem would result in considerable savings to the automobile driving public that they wrote into the law a provision calling for a 15 per cent reduction in bodily injury rates. And we might say in passing that with a 53 per cent reduction in both the number and cost of claims paid in the first six months of 1971, a clamor has arisen for rebates on the premiums paid. A bill designed to return money to Massachusetts motor vehicle operators because of savings realized by the insurance companies during the first year of the Massachusetts no-fault plan is expected to be enacted into law shortly. Under the bill, the insurance commissioner is authorized to conduct a hearing and determine whether or not insurance companies have "realized" "unfair" profits from 1971 compulsory auto insurance rates.

BENCH MARK OF "TRUE" NO-FAULT LAW

The point to be remembered, therefore, is that the bench mark of a true no-fault law is in the extent of its limitations on suits. And in this connection we do not hesitate to say that of the laws passed by the Senate to date very few, if any, qualify even remotely for this category. In all too many cases, there has been a disposition to give only token recognition to the fundamental concept of no-fault insurance by holding down the limits which a policyholder can obtain from his own company on a first-party basis—leaving the remainder to be settled in the already overcrowded courts. In effect, what has been done in many of the states which have passed so-called no-fault legislation is merely to plaster onto the tort system just as little first party coverage as the legislators can get away with—and still label the legislation "no-fault." These are pseudo or counterfeit no-fault laws, particularly those that contain little or no provision for limiting suits for pain and suffering and thus tend to guarantee continuance of the high legal costs which play such an important role in keeping the automobile

rate level at or beyond the reach of so many automobile owners today. And it is no secret that the sponsors of these laws among the legal profession are aided and abetted in their efforts to maintain the present tort system by segments of the American Agency System which, of course, have a stake in the situation by reason of commissions paid to produce business for the companies. On more than one occasion we have heard top company executives bewail privately that because of this latter situation they have been hampered in their efforts to bring about an intellectually honest approach to no-fault legislation.

MASSACHUSETTS AND FLORIDA LAWS

As against these types of greatly "modified" no-fault laws stand such legislation as passed in Massachusetts and Florida. It is generally conceded that in both instances there is at least a recognition of the fundamental concept of no-fault insurance which calls for getting more dollars into the hands of people who really need them—without recourse to the courts. The Massachusetts no-fault law is limited to the compulsory \$2,000 bodily injury insurance which all motorists must carry. Under the terms of the law, motorists are prohibited from suing for pain and suffering unless their actual medical bills total more than \$500. Instead, they collect from their own insurance companies out-of-pocket medical expenses plus up to 75 per cent of lost wages not exceeding \$2,000. It is estimated that 90 per cent of all Massachusetts bodily injury claims are under \$2,000. As indicated above, a reduction of 15 per cent in bodily injury rates was written into the law with this in mind.

In upholding the constitutionality of the Massachusetts law, the Supreme Court of the state said that while the no-fault goes a long way toward taking away such forms of redress as payments for pain and suffering, it is balanced by the guarantee of prompt payment for other costs of an accident. This was the court's answer to the "due process" challenge which had been levelled against the new law.

The Florida law makes no-fault mandatory for all drivers in the state and provides for payments to auto crash victims up to \$5,000 in medical and wage loss expenses from their own companies, regardless of who caused the accident. It prevents court action for additional benefits until at least \$1,000 in medical expenses have been incurred, unless there is disfigurement, disability or a serious bone fracture. Unlike the Massachusetts law, the Florida law covers auto damage, but bars suits under that cover below \$550. In this connection, it is interesting to note that there is a strong movement in Massachusetts to include property damage in the no-fault law. Like Massachusetts, Florida wrote into the law a 15 per cent reduction in rates.

STEPS IN THE RIGHT DIRECTION

In all fairness, it must be admitted that while the Massachusetts and Florida laws represent steps in the right direction, they are still far from meeting the standards of a "true" no-fault law. To meet those standards, there will have to be a sharp and pronounced raising of the ceiling on what the policyholder can receive in the way of benefits from his own company—a situation which necessarily calls for a considerable narrowing of what might well be described as the tort or suit area. Limiting the direct first-party payments to \$2,000 or even \$10,000 will hardly accomplish this purpose!

Whether the states are ready to take a greater plunge into the truly no-fault area, we have serious doubts—what with the trial lawyers lobby and certain segments of the agency forces being as powerful as they are at the state level. Already there is under way a movement to extend the two-year grace period originally granted the states to get in line on no-fault. But whether another two-year extension would accomplish any meaningful purpose, may well be questioned. It's a long step from a full tort liability system to no-fault!

PUBLIC THE FINAL ARBITER

What should be kept in mind, however, is that the final arbiter on whether there is to be a no-fault auto insurance system in this country is not the special interest lobby but the automobile driving public which is running out of patience with the constantly increasing insurance rates. Recognizing this, the stage is already set for further hearings this fall in Washington before the Senate Commerce

Committee. And incidental to these hearings the Hart-Magnuson and Moss proposals—as set forth in S. 945 and H.R. 7514 currently before Congress—will be given an airing, particularly as to the provisions calling for payment of all medical, rehabilitation and incidental expenses not covered by some other source and a monthly payment to the wage earner of 85 per cent of his lost income or \$1,000—whichever is lower—for a period of 36 months. Then again, there is that provision calling for cash payments of up to \$30,000 for surviving dependents of a wage earner who dies as the result of an auto accident.

These and other provisions of the Hart-Magnuson and Moss bills—particularly the limitation of the suit area to cases of "catastrophic harm" such as permanent or total disability—will certainly serve to place the states on the defensive for their piddling no-fault legislative efforts—or lack of legislative efforts—to date. Add to this the complaint so often heard today that a state-by-state approach to non-fault is absurd without any enforceable standards with teeth in them, and you can see that unless there is a sharp turnabout in the attitude of state legislators toward no-fault auto insurance, the states are almost sure to lose a goodly amount of their regulatory power over automobile insurers.

This is straight talk from a long-time champion of state regulation. It is to be hoped that the states will get our message before it is too late!

ROGER KENNEY.

Senator HART. Also, for the record a chart showing the 20 States with the greatest vehicle registrations and the insurance reform progress in those States.

I think it fair to note that only two of those States have adopted limited no-fault.

One has required the mandatory first-party benefits with limitations on pain and suffering.

(The chart follows:)

NO-FAULT¹ AUTO INSURANCE LAWS—20 LEADING STATES BY MOTOR VEHICLE REGISTRATIONS ESTIMATED FOR 1971

[In millions]

| | Amount | Plan |
|---------------------|------------|------|
| California..... | \$12.3 | None |
| New York..... | 6.9 | None |
| Texas..... | 6.9 | None |

Senator HART. I would like to read an editorial in the *Baltimore Sun* on September 24, 1971, entitled "Car Insurance":

A special Maryland legislative committee, loaded with lawyers, got off to a negative start in its consideration of no-fault auto insurance. The "hoax" label was applied before thorough study of the proposal, which is intended to eliminate the delays and cost in settling auto insurance claims by providing that the claimant's damages be paid by the claimant's insurance company, without litigation, regardless of who may have been at fault in the accident.

Elimination of the red tape and legal fees now common in the settlement of auto insurance claims, as opposed to most other forms of insurance, would of course cut into the income of the legal profession. But legislators who are also lawyers (as about a third of Maryland's lawmakers are) owe it to their constituents to rise above their own financial concerns and consider the public advantage of reduced auto insurance costs.

While the no-fault plan has been given an initially cool legislative reception, an even colder front has developed in advance of consideration of the Jewell plan of having the state provide minimum liability auto insurance coverage. As the state secretary of licensing and regulation, Mr. Jewell was asked by Governor Mandel to investigate not only the high cost of car insurance but also the cancellations, renewal refusals and penalizing premium rates which, in the Governor's words, have reached the point where "even the average driver is finding it difficult to obtain coverage at regular rates."

Mr. Jewell has proposed that the state provide liability coverage for all Maryland licensed drivers with premiums based on driving and accident records. Nobody's insurance would be cancelled unless his license was revoked, and there would be no rate differentials based on age, sex, occupation, race or place of

residence. Premiums would be paid in part when tags and licenses are renewed and in part as an extra 2-cents a gallon gasoline (the "pay-as-you-drive" plan).

Mr. Jewell's plan is a bold one and not yet fully laid out, since his formal report to Governor Mandel is still at least six weeks from completion. But it has drawn an immediately negative reaction from private insurance spokesmen, just as the no-fault proposal (which insurance companies favor) has brought opposition from lawyers. The Jewell plan also has prompted adverse reactions among state transportation officials who are leery of any infringement on their motor vehicle revenues.

The discernible danger at this point is that one plan will be used against the other in arguments that end in a draw and no action. Yet private car insurance is not now working well in Maryland. A long series of public hearings have brought forth a parade of Marylanders who have described their troubles in getting and keeping car insurance. Legislative action definitely is needed, and it becomes the obligation of legislative leaders to see that proposals get a thorough, objective examination instead of automatic, adverse criticism.

Also an article in the *Journal of Commerce* dated September 30, 1971, entitled "No-Fault Proposal Shelved in California."

Journal of Commerce Special.

Sacramento, California, September 29—California State Senate Judiciary Committee, composed entirely of practicing attorneys, has turned down any consideration of a modified no-fault auto insurance bill during the year.

The California proposal, the final one of three to be considered, was shelved by the committee by referring it to year-long interim study.

The modified proposal covering accidents up to \$10,000 had previously received approval in the California Assembly's lower house.

Also, an article in the *Journal of Commerce*, dated October 8, 1971, entitled, "Maryland No-Fault Proposal Gets Chilly Reception From Study Group."

Journal of Commerce Special.

Annapolis, Md., Oct. 7—A proposal to set up a system of no-fault automobile insurance in Maryland has received a cool reception from an eight man legislative committee which has six lawyers as members. Del. Alan M. Resnick, D-Baltimore, an attorney who said he handled no auto negligence cases, assailed no-fault as a hoax on the American public.

The proposal drew similar criticism from other senators and delegates on the committee. In addition to the lawyers, one member is an insurance agent. Two members of the committee are on record in support of no-fault.

Del. Charles S. Blumenthal, D-Prince Georges, a backer of the no-fault plan, but not a member of the committee, said his proposal "will hurt the legal profession financially."

He said legal fees in accident cases are so high that automobile insurance premiums are soaring.

More than one-third of the 185 members of the General Assembly are lawyers. One legislator estimated privately that a no-fault plan should cost those members \$500,000 or more in fees each year.

Members of the committee supporting no-fault are Chairman Edward P. Conroy, D-Prince Georges, and Senator Newton I. Steers, Rep.-Montgomery.

Gov. Marvin Mandel has argued that no-fault does not absolve two of the major problems with auto insurance, cancellations and "blackouts" of certain areas. He has indicated interest, however, in the "pay-as-you-drive" plan proposed by John R. Jewell, state secretary of licensing.

Lastly, a letter from Norman V. Harris, 244 Country Club Terrace, Battle Creek, Mich., to me, dated September 15, 1971, in support of no-fault insurance:

Having spent 30 years in the insurance claim business and an officer of an insurance company, I want to express my admiration for your dogged stand on Federal no-fault legislation.

The enacted state bills to date are so watered down as to defeat their avowed purpose and merely add to the jumbled mess already prevailing.

Somewhere somebody has to take the self-serving amendments out of what is originally an excellent proposal.

Keep up the good work and serve the majority of us in this State!

Senator HART. In connection with the reservation that written requests should be addressed to and received from the several witnesses by members of the committee, there should be a time limit fixed.

I suggest that the members who would want to address questions, submit them within 7 days, and the record will be held open for an additional 7 days for such responses as are received.

The committee is adjourned.

(Whereupon, at 3:35 p.m., the committee was adjourned.)

ADDITIONAL ARTICLES, LETTERS, AND STATEMENTS

STATEMENT OF FRANK N. BRATTON, PRESIDENT OF THE TENNESSEE BAR ASSOCIATION, ATHENS, TENN.

Mr. Chairman and Members of the Committee: I appreciate your extending an invitation to me to appear here and present my views with respect to Committee Print One of the National No-Fault Motor Vehicle Insurance Act (Senate Bill No. 945).

With your permission and in order to make my comments more easily followed I shall make specific comment on individual portions of the Act and conclude my remarks with a general statement concerning the Bill and the basic philosophy behind it.

SECTION 2, SUBSECTION (1)

My first comment regarding the Bill is that the definition of a motor vehicle is, in my opinion, too broad. Just recently a Tennessee trial court directed a defendant verdict where the court held that a five horsepower motor scooter operated by a ten year old boy was a motor vehicle within the meaning of a Tennessee Statute. The ten year old boy was charged with the same degree of care as any other driver and his contributory negligence thus barred the action. The Tennessee definition is similar, in many respects, to the definition in Subsection (1) of Section 2 of the National No-Fault Insurance Act as presented in Committee Print One.

Similar situations can present themselves in cases arising out of incidents of children operating "Go Carts" propelled by motors manufactured for washing machines and mowers and other small appliances. My suggestions would include making the definition more specific in order to exclude such incidents from coverage within the concept of No-Fault Motor Vehicle Insurance.

SECTION 2, SUBSECTIONS (8) AND (9)

Subsections (8) and (9) of Section 2 appear to be in conflict. Subsection (8) specifically excludes payment to injureds involved in "repairing, servicing, or otherwise maintaining vehicles unless the conduct occurs outside the premises of such business." Subsection (9) says, "The term 'motor vehicle accident' means an accident arising out of the operation, maintenance, or use of a motor vehicle."

To illustrate, if a service station attendant changes a tire or does any other work on a motor vehicle at, in or near his garage or service station, he is excluded from coverage. However, if the attendant leaves his place of business and is injured while changing a tire or in doing other work in, on or about the vehicle, he is covered. Since it is implicit that the Bill is to cover all motor vehicle accidents, it is not fair to exclude persons injured while maintaining or servicing motor vehicles based solely upon location when injured.

SECTION 2, SUBSECTION (12)

Subsection (12) of Section 2 states: "The term injury means accidental harm not resulting in death." This term could easily be construed to cover cases of fright and functional overlay—matters susceptible to being faked and simulated. It would seem that the word "injury" should be used in lieu of "harm."

SECTION 2, SUBSECTION (13)

Subsection (13) of Section 2, which sets forth amounts of compensation, is too restrictive as to the amounts payable. If the Act is to reimburse a person for an economic loss while recovering from an injury, some sliding scale method must be employed, based on living expenses of the injured before the accident. Under the provisions of this subsection there is no differentiation made in the

compensation payable to a person with one dependent and that available to a person with twelve dependents. Furthermore, statistics show that in approximately 50% of the accidents where personal injuries are sustained, the injured suffers a permanent disability of some type as well as economic loss while away from work. If he is restricted in his recovery solely to payment for economic loss while away from employment, a portion of his physical functioning is being taken without compensation.

SECTION 2, SUBSECTION (14)

Subsection (14) of Section 2 provides that, "monthly earnings shall be determined as one-twelfth of average annual compensation, after income taxes." The reduction of monthly earnings by deducting taxes is unfair in my judgment. The injuries were not self-inflicted, the injured is not at fault. The injured and his family should be provided with all possible benefits and not be penalized to the benefit of the carrier.

Part (c) of Subsection (14) of Section 2 formulates an unrealistic and impossible method of reaching the monthly income of an unemployed person. Why not compute the compensation of an unemployed on the basis of need for maintenance and dependency, where prior employment experience is not available?

SECTION 2, SUBSECTION (15)

Subsection (15) of Section 2 provides that the term "net economic loss" means, in case of injury or death, actual economic loss reduced by the amount of any benefit or payment received from, (A) any public health insurance or plan (B) any private insurance or plan containing explicit provisions making its benefits primary to any benefits under a qualifying no-fault policy.

Provision (B) acts to penalize the prudent individual who has insured himself over and above minimum amounts. Such individuals have paid premiums for the additional protection and it is unfair to deprive them of the benefits for which they have contracted.

SECTION 4

Section 4 provides for mandatory insurance but does not provide for regulation and administration so as to maintain the insurance in effect for the duration of the period during which the vehicle is operated upon the streets or highways. Guidelines should be established for the exhibiting of proof of continuous insurance coverage at each licensing period, said coverage to extend at least until the next licensing or registration period of that vehicle.

Obviously, this provision will work a hardship on those persons unable to purchase insurance on an annual basis, but it is necessary to assure other persons of protection. Further, it will create great hardships upon State licensing and registration agencies which will have to enforce this provision. Perhaps then, the better solution, if this entire program is to be effectuated, is to remove the registration and licensing of motor vehicles functions from the States and lodge it with the Administrator of the Act.

There is much to be said for the issuance of a permanent, federal registration number for each motor vehicle driven upon the highways of the nation. Such licensing would provide greater control over each vehicle so licensed.

SECTION 3

Section 3, in a mere thirteen lines, totally abolishes the entire concept of tort law relating to automobile accidents.

Under the Constitution of the United States, the Courts are to remain open to all persons whose liberties, rights and guarantees are disturbed. Now Section 3 would act to destroy and abolish the rights of persons to have their day in Court and their civil wrongs righted by the award of monetary damages if they are injured as the result of a motor vehicle accident. The entire concept of our government was and should remain that no person shall be deprived of his right to have his grievances presented before and determined by a jury of his peers. This is just another example of the erosion of the Constitutional rights of the American Citizen, which we witness so frequently today.

Even if, under the guise of pretending to protect the public by saying that as a condition precedent to the operation of a motor vehicle the owner loses his

right to maintain a tort action for his damages, reasons are non-existent to sustain the removal of the right to maintain a tort action by those riding in a motor vehicle or walking along the streets and those whose property, other than motor vehicles, is destroyed or damaged. The innocent pedestrian and the occupants of an automobile can not conceivably be considered parties to a no-fault insurance statute. Nevertheless, under the Act, as drawn, they are precluded from bringing suits to right their wrong.

SECTION 5, SUBSECTION (2) (A)

The insurance requirements embraced within Section 5, Subsection (2) (A), precluding the payment to occupants of a motor vehicle other than the insured motor vehicle, which acts to strip persons of their rights to payment under the Act or to maintain a tort action, is utterly ridiculous.

SECTION 5, SUBSECTION (5) (C) (1)

Subsection (5) (c) (1) of Section 5 provides the vehicle owner with the option of insuring his automobile against damage with such deductible as he elects. The two year study conducted by the Department of Transportation indicates that there are ten times more accidents involving only property damages than those involving bodily injury. Fifty-three percent of the property damage premiums in 1968 was paid out to claimants for property loss. The study further reflected that in the 1969-1970 period, 72% of the premium dollar was paid out on property damages. In dealing with property damage claims we are dealing with tangibles, not human bodies. Yet, this Act does not attempt to provide for payment, on a no-fault basis, for property damages, although the claims for such losses are ten times greater in number. A real service might be rendered the owners of motor vehicles whereby all damages to motor vehicles would be paid and the insurers left with rights of subrogation against the other carrier.

CONCLUSION

My commenting specifically on Committee Print One of the National No-Fault Motor Vehicle Insurance Act should, in no way, be construed to mean that I favor the Act, even with the amendments above set forth. As an individual lawyer, I am opposed to the enactment of any such Bill in principle. As President of the Tennessee Bar Association, I am committed to the policy of the Association, as adopted by our Board of Governors, and that is opposition to Senate Bill 945 specifically and to any Bill which would act to abolish the tort system in compensating victims of automobile accidents.

The whole concept of a No-Fault Insurance Statute was conceived as a vehicle to (a) reduce insurance premiums, (b) prevent the arbitrary cancellation of insurance policies and refusal of insurance companies to renew policies or to write new policies, (c) provide a more equitable recovery for motor vehicle accident victims, (d) provide for a quicker or more expeditious payment to motor vehicle accident victims, and (e) reduce the portion of the premium dollar retained by the insurance carrier of 42¢ and that received by attorneys of 16¢, so that more than the now remaining 42¢ net might be available for payment to claimants.

My objections to Committee Print One of the National No-Fault Motor Vehicle Insurance Act (S. 945) are that:

(1) The Congress should not preempt the field of No-Fault Insurance from the States without giving the individual States an opportunity to enact legislation in a field which is purely local in that the motor vehicles are licensed by the States, travel and traverse roads within States and the State courts handle the litigation arising from the use of motor vehicles;

(2) The Congress is attempting, by the enactment of Senate Bill 945, to set up another bureaucratic agency to regulate motor vehicle accidents, many of which will occur in far removed areas from Washington, without even the slightest guess as to costs;

(3) The Congress should not encroach upon the right to contract of either insurance carriers or individuals under the guise of lower insurance rates. The two year studies of the Department of Transportation shows that only 42¢ of every personal injury premium dollar was paid to claimants for injuries received in motor vehicle accidents, 16¢ were collected by lawyers and 42¢ were retained

by the insurance carriers. Fourteen cents of the 42¢ retained by the carrier was used in adjusting claims. The same study shows that only 45% of all motor vehicle accident victims were compensated in some amount. The study further indicated that insurance rates varied from state to state. Therefore, it appears that an attempt is to be made to take the 16¢ paid out in lawyers' fees and the 14¢ paid by insurance companies for adjusting and pay the 55% of the motor vehicle accident victims who are now uncompensated. Obviously, if the Statute is enacted, premiums will have to be adjusted so that the insurance carriers can make a profit. Eventually, a Federal Insurance Company will have to be established, and instead of premiums being reduced they will rise from time to time to cover all motor vehicle accident victims.

(4) The Act takes from citizens of the United States one of their most precious rights, the right to recover for personal injuries and property damages. The Act further discriminates against those who are injured by and in motor vehicle accidents by taking from them their right to have the Courts and juries determine and settle their rights to damages, while leaving other citizens, who fall on private property, are injured in a train accident, are injured through some products deficiency or countless other means, their recourse to the courts.

(5) Although the uninsured pedestrian or the occupant of an uninsured motor vehicle may not own a motor vehicle and, therefore, have not submitted themselves to the control of the No-Fault system, their rights to recover from injuries sustained as a result of automobile accidents are destroyed by the proposal.

In conclusion, I would urge the Committee to pause long before recommending for passage any legislative proposal which would effect so drastically the basic right of the American Citizen to a trial by jury.

BOYNTON BROTHERS & Co.,
Perth Amboy, N.J., September 29, 1971.

Re "No Fault" Auto Insurance.

HON. WARREN G. MAGNUSON,
Chairman, Committee on Commerce, U.S. Senate,
Washington, D.C.

DEAR SENATORS I notice that meetings will be hold in the near future in connection with the Hart Bill for "No Fault" Auto Insurance in the United States. Frankly, I believe that is the only correct procedure in handling this situation because if it is left up to the various states very few plans will be put into effect.

Most of the members of the Senate and Legislature in the various states are made up of attorneys and they are almost one hundred percent against such a plan.

I am enclosing herewith a copy of a letter you wrote to Senator Clifford P. Case indicating that when hearings are planned on the Hart Bill you were to include me as a prospective witness.

I have been in the insurance business as an agent for 52 years with this company, which is one of the large insurance agents in the State of New Jersey. I am perfectly familiar with all phases of automobile insurance because we wrote a substantial amount of such business and in addition, we have always had a Claim Department next door to our main office here in Perth Amboy. In fact, a number of years ago we built a building for such a Claim Department but that condition no longer exists because the Claim Department which was formerly in the office next door and the one in Trenton were both closed and the claims are now being handled from Eatontown, New Jersey. Having this knowledge, I am fully familiar with all types of automobile claims and all types of automobile insurance and I know the weaknesses in the present situation.

I drew up a "No Fault" Plan which was sent to Mr. Robert L. Clifford, the Insurance Commissioner of the State of New Jersey. A copy was also sent to an executive of the Continental Insurance Companies with no comment from them and I also discussed this Plan with a number of service groups where I was well received.

I know that this Plan is not perfect but I am sure that many of the recommendations in my plan will have to be put into effect if any plan is adopted for all the states in in this country. When the hearings are being held, I would appreciate the opportunity of giving my opinion on this situation. I will not be available during the month of November because I am going down to Lake Taupo

in New Zealand for some rainbow trout fishing; all other times I would be available.

Hoping I may be of service to you and your Committee in this situation, I am
Cordially yours.

D. W. BARTHOLOMEW, *Chairman.*

"NO FAULT" AUTO INSURANCE

1. To start such a Plan, all automobiles must be insured. To make certain of this the Motor Vehicle Department should have the renewal license for the automobile made up in a double card system by the applicant. One portion could be used for the license information and the other portion could be used for indicating the name of the insurance company and the policy number. Under this Plan, the one card should be mailed direct to the insurance company and it would be their obligation to notify the Motor Vehicle Department if the automobile was not insured. If the insurance is cancelled at any time for various reasons, it would be the obligation of the insurance company to notify the Motor Vehicle Department immediately and it would be up to them to pick up the license of the applicant.

It is now estimated that in the States of New Jersey, New York and Massachusetts that at least 250,000 automobiles in each State are not insured properly; although, the application for the license indicates the car is insured. If this is so, it is due entirely to the negligence of the Motor Vehicle Departments because it is their absolute responsibility to check with the insurance company named in the application in order to verify whether the automobile is properly insured as required by the Motor Vehicle Law. In this particular situation, it is up to the Motor Vehicle Department of the State of New Jersey to definitely set up a plan where there is no negligence whatsoever involved in the insurance. At the present time, I believe, this situation is not properly handled by the Motor Vehicle Departments in the States of New Jersey, New York and Massachusetts.

2. If no insurance company wants to insure an applicant, then the Insurance Department must set up an Assigned Risk Plan, somewhat similar to the plan now in effect in New Jersey. Also, there must be taken into consideration the accident record of the applicant, the motor vehicle offense record and the character of the applicant based on his vocation and drunken driving record. In some of these cases, they would not be entitled to any insurance whatsoever and the rules for this procedure should be laid down by the Insurance Department of the State of New Jersey.

3. The insurance rates now in force in the State of New Jersey for insuring automobiles should remain "as is" until the accident record is proved by statistics to require a change by an increase or decrease, whatever the case may be.

4. It is recommended that the limit of insurance for loss of wages, medical bills and so forth under the "No Fault" Plan should be at least \$20,000 per accident. This would eliminate at least 90% of all accidents from court cases. The saving in the cost of defense attorneys, paid for by the insurance company, court costs and judges salaries would amount to many millions of dollars and help to lower State Taxes.

5. The applicant for insurance should carry a higher limit for accidents to pedestrians, accidents to out-of-state cars and other claims not specifically covered under the "No Fault" Plan.

There must also be taken into consideration as to how commercial automobiles, such as trucks and busses, would apply under the new Plan. Obviously, trucks and busses would not be included in the Plan so the insured could sue these parties in the event of an accident.

6. For Property Damage—each applicant should purchase Collision Insurance on his own car and Property Damage Insurance for legal liability damage to other property, excluding his own automobile.

Under this section, it should be indicated whether an insured who has damages to his own car could sue any other party in connection with a collision claim. If Collision Insurance is purchased, the insurance company should have the right, under subrogation, to go after any other party responsible for the damages.

7. The purchase of Comprehensive, Fire and Theft Insurance should still be voluntary and should be handled by the applicant in any way he sees fit.

8. If these is a justifiable claim by an automobile owner under this Plan, where he or she would be entitled to more than \$20,000—a court suit would be

allowed; but if the insurance company pays any amount to the policyholder up to \$20,000 for any accident and should a suit be instituted and if the amount received is more than \$20,000, the amount paid under the "No Fault" Plan by the insurance company should be paid to them in full and the attorney fee would only apply on the amount collected over \$20,000.

9. Here is a difficult situation to work out. Many applicants will have accident and medical insurance protection in other insurance companies, either furnished by their employer in a group plan or purchased individually. If such additional insurance is available at the time of accident, some plan will have to be worked out with the other insurance companies so that there is some kind of a pro rate payment on the claim. This would be very difficult to work out statistically but it could be done. It might be possible that the other insurance companies would change their coverage applying in the State of New Jersey to be Excess over and above what would be paid under the "No Fault" Plan. Or, it could be worked out so that other plans should pay up to their limit and the amount paid under the "No Fault" Plan could be considered only as Excess Insurance.

Also if an injured person is on welfare or social security payments, that must also be taken into consideration.

10. If the insurance companies refuse to go along on these plans, then the Insurance Department should put all automobile insurance in this State under an Assigned Risk Plan and all the companies would share pro rata on each loss. There are probably 150 companies now under the Assigned Risk Plan, so the loss to any one would be minor in nature.

In connection with such insurance, benefits for lost wages and medical attention would be paid under a possible Compensation Claim. This must be taken into consideration. Obviously, if not taken into consideration, an insured under this plan could collect both ways for a compensable accident.

It is true that under this plan the income of many attorneys who specialize in negligence cases would be substantially reduced; that is unfortunate. However, these attorneys must understand that the insurance agents in New Jersey have suffered very, very much from reduced commissions they have received on automobile insurance due to the bad accident record in the State. They have lost substantial income, too. There is one other feature in connection with automobile insurance in this State that must be recognized; although, it is now in effect in the State of Virginia. It is a known factor that many insurance companies have lost money on underwriting automobile insurance in this State as well as other States but at the same time, it is agreed that very few of the companies have actually lost any money because of their income from investments and also capital gains. The Supreme Court in this State will soon rule on this situation but, I believe, it is virtually useless to try to adopt this procedure because almost all insurance companies in this country have a different investment portfolio with the result, many companies are making very little from investments and others are making a lot of money. Therefore, it would be very difficult to base automobile insurance rates in this State on investment and capital gain profits because the percentage would be different in every insurance company. The best plan to take care of this situation would be to publish automobile insurance rates on actual experience and then at the end of each year, when the complete financial statement of an insurance company is available, the Insurance Department could set up a statistical plan where the companies that are making the most profits would have to provide the insurance at a standard rate, less a certain percent of the profit they have made from investments. This may lead to a chaotic situation but, from my standpoint, this is the only way it could be properly put into effect.

While in Canada last April and May, I studied the automobile insurance situation in almost every Province. In several of them, compulsory insurance is required. One or two require insurance for operators under 21 years of age. Several indicate that where they do not require compulsory insurance, if an accident occurs for which the operator is liable for damages, that operator cannot continue to operate an automobile until the claim is paid in full.

I also checked the situation in New Zealand. In that country, they are putting into effect a compulsory insurance plan that is based on payments to claimants similar to Compensation Insurance.

And finally, this must also be taken into consideration at this time—the fact that most of the large major companies have been bought out and are now in what we call a conglomerate. Most of these conglomerates have a Board of Directors

and they really know nothing about the insurance situation. However, they do run the companies in spite of the fact that these subsidiary companies have a separate group of officers. It is my opinion that all these insurance companies should be owned and operated by their own stockholders and nobody else.

I am quite sure that this proposal will not be acceptable and will be criticized. There is no perfect "No Fault" Plan but this plan I recommend is better than what we now have in effect and is worth trying.

FINANCIAL STATEMENTS, JAN. 1, 1964, TO DEC. 31, 1968

| | Underwriting
loss | Investment

| U.S. Fidelity & Guaranty Co. | 2,529,000 | 133,264,000 | 124,950,000 | 9,031,000 | 72,611,000 |

¹ Minus mark for capital gains refers to losses.

² Minus mark under taxes paid represents the refund of taxes from the Internal Revenue Department.

Note: This statement represents the 5-year figures for 11 of the larger stock companies. They are particularly impressive because in 1969 these same companies demanded higher insurance rates in New Jersey and increases in automobile rates went into effect February 1970. These companies are still not satisfied. The Supreme Court of the State of Virginia ruled that investment income of insurance companies must be taken into consideration when applying for rates. These figures were taken from Best's "Key Rating Guide—Property-Liability" and published in 1969. The figures, therefore, are correct. (The person who prepared this data, desires to remain anonymous.)

AMERICAN ASSOCIATION OF RETIRED PERSONS,
NATIONAL RETIRED TEACHERS ASSOCIATION,
Washington, D.C., October 20, 1971.

HON. WARREN G. MAGNUSON,
Old Senate Office Building,
Washington, D.C.

DEAR SENATOR MAGNUSON: Recognizing the inequity and inadequacy of the present fault system of automobile insurance, the American Association of Retired Persons and National Retired Teachers Association, with a combined membership of over three million older citizens, have come to favor the principle of "no-fault" insurance under which accident victims will receive compensation for loss from their own insurers without the delay, frustration and expense incidental to the determination of fault required under the current system.

To perfect adequately this new insurance concept, AARP-NRTA support its implementation at the state level where there may be introduced whatever variations will best accommodate the needs of the people of each jurisdiction. However, our Associations believe it is essential that Congress legislate certain minimal no-fault standards with which each state must be required to conform within a Congressionally defined, reasonable period of time. Such guidelines should provide a certain basis, common to the laws of all the states, that would preclude that unduly disruptive diversity among state laws that often results in the neglect or disregard of important interests in need of protection and, at the same time, guarantee the creation of a nationwide system of genuine no-fault coverage. The Congress should, perhaps, consider providing certain inducements to encourage each state to enact a qualifying no-fault law within the established time; but it must reserve to itself the preemptive right to intervene, should a state fail to enact such a law within such time.

Our Associations are aware that the Senate Commerce Committee is about to consider no-fault legislation in executive session. As a member of that committee, we urge you to accept the no-fault principle and to work for the adoption of a guideline approach to guarantee its implementation at the state level.

Since our Associations are seriously concerned with the problems of declining mobility and increasing isolation of older persons, we especially wish to obtain your support for the prohibition of the unreasonable and irrationally

discriminatory practice of cancelling or denying automobile insurance on the basis of age alone. Statistics have recently established that older persons, as a class, are safe drivers; the laws of each state must provide for mandatory no-fault insurance protection for all licensed drivers.

Finally, our Associations ask that you be mindful of the fact consequences to elderly persons of no-fault insurance. Since the benefits of Medicare are already available to persons receiving social security, social security benefits should be considered primary to the personal injury benefits under the no-fault policy. Consequently, in order to provide a superior standard of medical coverage and an incidentally higher premium rate which would be an unnecessary burden on the fixed incomes of elderly persons, insurers in each state must be required to provide no-fault coverage at a reduced rate which fully reflects the amount of the primary collateral benefits available under Medicare. To guarantee this result, our Association especially urges your support of a statute mandating requiring insurers in each state to contract with and harmonize their no-fault policy coverage with the benefits available under Medicare and any subsequent and approved national health plan.

Sincerely,

CYRIL F. BRICKFIELD
Legislative Council

AMERICAN ASSOCIATION OF RETIRED PERSONS,
NATIONAL RETIRED TEACHERS ASSOCIATION,
Washington, D.C., October 28, 1971.

HON. WARREN G. MAGNUSON,
Old Senate Office Building,
Washington, D.C.

DEAR SENATOR MAGNUSON: We wish to correct a discrepancy between our letter of October 20, 1971 and our official position on no-fault insurance, a copy of which was attached to that letter. It is our official position that insurers be *permitted*, rather than *required*, to provide no-fault personal injury coverage at a reduced rate which reflects the amount of the collateral benefits available under Medicare.

The expectation of the imminence of the meeting of the Commerce Committee in executive session to consider no-fault legislation caused us to act with haste; we apologize for the error and hope that the discrepancy has been adequately corrected. We have attached herewith an additional copy of our position statement.

Sincerely,

CYRIL F. BRICKFIELD,
Legislative Council

Enlosure.

STATEMENT OF THE NATIONAL RETIRED TEACHERS ASSOCIATION, AMERICAN ASSOCIATION OF RETIRED PERSONS

We support the principle of no fault insurance whereby accident victims may recover losses from their own insurers without undue delay and without regard as to who is at fault. We, therefore, request that state insurance laws be revised whenever necessary to introduce no fault personal injury automobile insurance. We ask that no fault coverage be made mandatory for every motor vehicle owner and that all insurance companies be required to sell no fault policies to all licensed drivers. As Associations representing over 3 million elderly, we feel that no fault insurance is especially important to the elderly who, as a class, have proved to be safe drivers, but who in too many cases are being denied insurance or otherwise discriminated against simply because of age.

We favor the implementation of no fault at the state level to encourage experimentation on a state-by-state basis in order that this new concept may be adequately developed and perfected.

At the same time we urge legislation by the U.S. Congress providing certain minimum no fault standards which each state must achieve within the next few years. The standards must include:

1. The benefits of Medicare should be utilized by those receiving social security and companies should be *permitted* to sell no fault insurance as excess benefits over those provided by Medicare, at substantially lower premium rates.

2. Maximum benefits should be high enough to cover all medical costs in the vast majority of cases. The right to tort action should be limited to cases involving serious misconduct or serious injuries. We believe that a maximum benefit of \$5,000 and a medical expense threshold of \$2,000 (in determining the right to tort) will achieve these desirable objectives.

3. Compulsory automobile insurance as respects no fault personal injury protections, residual bodily injury liability insurance and property damage liability insurance.

In the event that any state or states do not enact no fault auto insurance programs within a reasonable period of time, the Federal Government should preempt their rights to regulate the automobile insurance business.

AMERICAN BAR ASSOCIATION,
OFFICE OF THE PRESIDENT,
Chicago, Ill., October 11, 1971.

HON. WARREN G. MAGNUSON,
Chairman, Committee on Commerce,
U.S. Senate, Washington, D.C.

DEAR SENATOR MAGNUSON: I acknowledge with thanks your letter of October 5 inviting me to appear as a witness in the hearing before the Committee on Commerce on S. 945, Committee Print One, on October 14.

Unfortunately, I must be in Chicago on that day to preside at the fall meetings of the Board of Governors of this Association. Since receiving your letter I have consulted with the Special Committee on Automobile Insurance Legislation of the American Bar Association, under the chairmanship of Judge John T. Reardon, as to whether that Committee may have additional testimony it wished to present at this time. I have been advised that it does not; that the Committee is continuing its review of developments in this field since the action of the House of Delegates of the Association, in August of 1969, in adopting a series of approximately 53 recommendations for improvements in the reparations system.

As you know, in May of this year, these recommendations and the full report of the earlier ABA Committee which gave long and intensive study to the whole problem, were placed before your Committee. At the earlier hearings in the spring Judge Reardon also appeared as a witness, as did Edward W. Kuhn, former President of this Association and chairman of a committee of the Section of Insurance, Negligence and Compensation Law concerned with consideration of state legislation. Their prepared statements also are a part of the Committee record.

At such time as Judge Reardon's Special Committee reports its findings and conclusions, and these can be considered by the official policy bodies of this Association, your Committee will, of course, be informed promptly.

Again, thank you for the courtesy of your invitation to appear at this week's hearings.

Sincerely yours,

LEON JAWORSKI,
President.

STATEMENT OF LORNE R. WORTHINGTON, INSURANCE COMMISSIONER OF THE STATE OF IOWA

My name is Lorne R. Worthington. Today I am appearing on behalf of the National Association of Insurance Commissioners, commonly referred to as the NAIC, both as the Insurance Commissioner of Iowa and as President of the NAIC. Having its inception in and regular meetings since 1871, the NAIC is the oldest voluntary association of state officials. It includes the principle insurance regulatory authorities of the 50 states, the District of Columbia, and the territories of the United States.

1. THE ISSUE

The Uniform Motor Vehicle Insurance Act would create a federally mandated motor vehicle insurance system predicated on the no fault concept for bodily injury. The statute, among other things, would prescribe the minimum coverage which motorists would be required to purchase. In contrast, although the

Administration has tentatively endorsed the no fault concept, it has concluded that mere speculation without actual observation of experience with a new plan is an inadequate basis for massive, uniform national reform; and that the federal assumption of the current state regulatory authority over automobile insurance poses great issues and consequences and is highly undesirable. The Administration recommends that solutions, built upon specified general principles, evolve at the state level to permit experimentation and testing of different approaches. *Thus the basic issue is joined—i.e., what is the most appropriate approach to test and/or implement the no fault concept.*

2. NAIC POSITION ON THE NO FAULT CONCEPT

At the outset, let me indicate the perspective from which the NAIC, as an association of state insurance regulators, views the fault versus no fault concept. The tort liability system is a legal system which is separate and distinct from the automobile insurance system. When the first automobile insurance policy was written prior to 1900, the fault concept was well embedded. The automobile insurance system, and the regulation thereof, of necessity, has in large part been engrafted on and molded by the broader legal environment in which it finds itself. As a consequence, automobile insurance was originally premised on the concept of protecting a person from economic disaster resulting from legal liability—by defending against claims and paying those adjudged to be valid. Only incidentally was the combination of the legal and insurance systems thought of in terms of providing reparation to the victim. In more recent years, there has been a shift in concept. Increasing attention has been focused on the plight of the victim. The inquiry now centers on how dependent upon fault the reparation system should be.

Obviously, the questions being posed extend far beyond the interests of automobile insurance and its regulation. Numerous groups are interested in the ultimate result. These include the policyholder, the claimants, the legal profession, the providers of medical services, insurers, agents, unions, etc. Because of the many groups involved, the extensive diversity within such groups, and the complexity of the issues involved, a wide range of conflicting attitudes and objectives exists. The NAIC, following a comprehensive background study by its Central Office staff, adopted a position statement which, among other things, said that question of fault versus non fault "is an issue involving wide spread ramifications far beyond the traditional confines of insurance regulation The decision as to whether the present system should be reformed is not a legal decision nor is it a statistical one; it is a question of values."

"Thus the type of system adopted is a broad question of public policy.

"The NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis."

Our responsibility as regulators is a limited one. If private enterprise is chosen as the implementing mechanism (whether the third party legal system is retained, modified, or eliminated), our function would continue to be regulation in the interest of a sound, efficient, and equitable system on behalf of the insurance consuming public.

Incidentally, state insurance regulation has no vested interest in either eliminating or continuing the third party legal liability system for automobile insurance. We currently oversee both fault and no fault type coverages. What is ultimately in the best interest of the public is what we favor and support. The problem is determining what is ultimately in the public interest.

3. THE STATE-BY-STATE APPROACH

While we as insurance regulators will not be the ultimate arbiters as to what constitutes the most appropriate reparation system in terms of public policy objectives, we do occupy a unique vantage point for observing the existing system. State insurance departments regulate insurers, examine their operations, approve policy forms, review policyholder and claimholder complaints, and re-

¹ H. R. Concurrent Resolution 241, 92d Congress, 1st Sess. (1971).
² NAIC Statement of Position on Automobile Insurance, *Report of the Special Committee on Certain Automobile Problems*, June 16, 1969, p. 17. The report was adopted by the NAIC in June 1969. In addition, the report contains the staff background study. A copy of the report is submitted for the record.

spond to all manner of consumer needs. Consequently, we have a continuing opportunity to closely observe the workings of the insurance mechanism and to do so from the public's viewpoint. Thus, in this sense, as well as from reviewing the studies made by the NAIC, DOT and individual insurance departments, we feel our observations will contribute to your deliberations.

The fault versus no fault concept poses numerous complex and difficult issues. Among the factors requiring primary consideration are finding a means to assure that payments are made promptly, that the distribution of claims payments is an equitable one, and that a greater percentage of each premium dollar is paid out to victims.

In addition, consideration must be given to: overlapping coverages and premiums, flexibility, and impact on rehabilitation. Implicit in these factors are conflicting attitudes and objectives. Public clamor over increased automobile insurance premiums has significantly added to the pressure for change. Proponents of no fault are urging that virtually all injuries be compensated regardless of fault. These are conflicting objectives—i.e. lower cost versus increased benefits. Thus a basic question becomes what benefits the public wants, what benefits the public is willing to forego, and what cost level the public is willing to accept.

The final report of the Department of Transportation, as well as Secretary Volpe's presentation, highlighted the multiplicity of options confronting us and the need for experimentation. For example, the report named six basic areas of consideration, each area involving numerous subconsiderations within itself: (1) the legal rule governing reparations, (2) the role of insurance, (3) the kinds of losses to be compensated, (4) private versus social insurance, (5) compulsory versus voluntary insurance, and (6) insurance and the loss minimization objective.³ Alternative approaches raised include (1) retain the status quo, (2) improve the present tort legal liability system (e.g. judicial reform, shift to comparative negligence, regulate contingency fees, etc.), (3) rely on evolutionary reform by combining fault and no fault coverages, (4) establish a total no fault system, and (5) utilize government insurance.⁴

In spite of the mass of research conducted, the general public has no clear concept of what is involved or the ramifications posed by the various alternative methods. The DOT report's section on public opinion makes this quite obvious:

"In general, these surveys indicate that *the public has mixed attitudes* about the performance of various aspects of the system, is generally ill-informed about the current system, and, on the whole, shows an openness to change when made aware of alternatives to the present system."⁵ (Emphasis supplied.) In short, a clear and informed consensus has not yet emerged.

With these and other factors in mind, the NAIC has said:

"Because factors, concepts, values, and attitudes vary from locale to locale, this public policy decision can best be made on a state-by-state basis rather than at the federal level. This, in turn, affords the opportunity to test and experiment with different approaches on a limited basis. After a period of experience with different plans, the better solution(s) will emerge. *The NAIC therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis.* Whatever the system, the various state insurance regulators can regulate for the public interest most effectively because of the varied needs of a differing populace in the several states. *The public, by its responses to legislation and by the decisions it makes in the market place in accepting or rejecting various coverages and services offered, will ultimately settle the issue.*"⁶ (Emphasis supplied)

This remains the judgment of the NAIC. Furthermore, it has been subsequently fortified by both Secretary Volpe's statement before the Senate Commerce Committee⁷ and by the DOT report which said:

³ See DOT, *Motor Vehicle Crash Losses and their Compensation in the United States*: a Report to the President and Congress 101-111 (March 1971) (hereafter cited as the DOT Report).

⁴ See *id.* at 112-127.

⁵ *Id.* at 81.

⁶ NAIC Statement of Position, note 2 *supra* at 17.

⁷ "Nor will I attempt to assess here the relative merits of all the various reform plans that have been offered as alternatives to the present system. In this thicket, there is plainly much less of a consensus: the complexity of the subject and its problems make possible an almost limitless number of combinations, permutations and variations of recovery rules, insurance coverages, etc." Statement of Secretary of Transportation John A. Volpe before the Senate Commerce Committee, March 18, 1971, p. 2.

"Moving in stages toward such a goal would allow us to test its virtues and discover its faults, thereby giving us new knowledge that could serve to modify the goal itself. A little observation is worth a great deal of speculation, and State experience with diverse plans will provide us with that opportunity for pilot project testing which must precede massive reform."⁶

Furthermore, Secretary Volpe said:

"First, it seems clear, at least to us, that *there remains much legitimate uncertainty about how far and how fast the public wants or is willing to go in changing the reparations system.* It is also clear that *there exists genuine and warranted concern as to the unknown and essentially unmeasurable price and cost implications of any major change in the system,* which of course would ultimately affect the cost and quality of service to consumers of insurance. Regulators and other responsible public officials would appear to share these feelings. We, ourselves, don't claim to have definite answers to these questions either. As a result, it seems to us that we should seek change through State action, but consistent with the broad outlines or principles of a system such as that described below. We need not and do not insist that a single reform system be imposed upon all the States. The experience of the States should have much to tell us about the most desirable final configuration of the motor vehicle reparations system."⁷ (Emphasis supplied)

In brief, we simply don't know at this point what the answer or combinations of answers are. With all due respect to the advocates of the federal no-fault plan, we submit that no one knows the answers to these questions (and others which could be posed)—and until we do, no one knows what final form a national program should take.

4. CAVEATS ON FEDERAL MANDATED STANDARDS AND VOLUNTARY GUIDELINES

Secretary Volpe urged that change commence now and the Administration is supporting a joint concurrent resolution putting the states on notice that they are expected to resolve this problem within a reasonable period of time. We don't disagree that some change is needed, although the magnitude or direction of change is subject to intense debate.

a. *Immediate Uniform Massive Change is Premature.*—At the one extreme the proposed Uniform Motor Vehicle Insurance Act would establish rigid statutory standards as to what must be in an automobile insurance policy. Such an approach has the practical effect of destroying flexibility and tends to freeze in limitations in coverage.⁸ Perhaps even worse, the uniformity imposed would preclude the consuming public from the opportunity to register its choice over a meaningful period of time and thereby make the insurance mechanism responsible to the public's evolving concept as to the appropriate balance between benefits and costs.

b. *The Cost Factor.*—No matter how hard we try, it is either impossible or foolhardy to ignore the ramified actions of the cost of any given program or alternative. As the NAIC staff study pointed out:

"In appraising the worth of any system, a very important consideration is the cost of such system as compared to the cost of possible alternatives. Public clamor over increasing automobile insurance premium levels has significantly added to the pressure for change."

"...the NAIC strongly supports efforts to reduce the cost of automobile insurance to the public to the extent that such reductions are consistent with other major objectives. It must be remembered that no program can meet all demands since the demands themselves are frequently in conflict. It is virtually impossible to pay more accident victims more dollars and reduce costs at the same time. Thus, whatever changes are recommended they should be evaluated with a view towards the best balance possible between *conflicting objectives and various risks between the 2) sources of increased benefits and cost savings.*"⁹ (Emphasis supplied)

As the 1977 report noted, consumer attitudes about automobile insurance have shown us cost to lead all other concerns.¹⁰ Consequently any program

⁶ NAIC, *supra* note 1, at 11.

⁷ Volpe, *supra* note 1, at 10-11.

⁸ The major advantage of a model policy is that it facilitates price comparisons. In addition, it provides a uniform standard of performance and non-competitive prices. Competition is thereby increased, leading to more competitive products and broader terms.

⁹ NAIC, *supra* note 1, at 10-11.

¹⁰ NAIC, *supra* note 1, at 11.

which does not afford the consumer an opportunity to relate the benefits he desires to the costs he must pay may create more public dissatisfaction than it eliminates.

This point is particularly relevant to a program such as automobile insurance whose costs are bound to increase. The DOT report has recognized:

"Perhaps the most pervasive influence upon automobile insurance as a public issue in recent years has been inflation."¹³

In effect, an automobile insurance company is a mass purchaser of a variety of goods and services such as medical, hospital, lawyer and court services, wage replacements, repair goods and services, etc. As the cost of these elements increase, the cost of insurance must do the same.¹⁴

"If such costs continue to inflate (and there is little reason to hope otherwise), initial cost savings resulting from changing the system would soon be forgotten and public frustration with costs would arise anew. This suggests that, while efficiencies in the system are important, drastic changes aimed at reducing premium levels (or lessening increases) may result in only temporary relief."¹⁵

Much of the American motoring public is being led to believe that no fault is a panacea, bringing with it broader coverage, payment in all cases, and lower costs. The idea that something must be given up in order to get something else back has not yet registered in many quarters. The passage of the proposed legislation, without a preliminary period of trial and error during which the public would become educated as to its advantages and disadvantages and would be able to relate its wants to its costs by choice in the free market, could set the stage for massive public disenchantment with all who were connected with its enactment.

The establishment of minimum mandatory benefits, such as those being discussed, in a federal statute poses far reaching, long-term ramifications. In fact, the same can be said, although perhaps to a lesser extent, as to the establishment of federal guidelines to which the states should strive since such guidelines would tend to become the minimum norm of consumers' expectations as to what they are "entitled to: by right."

If the cost of such benefits exceeds what the public is willing to pay, federal subsidies may be necessary and you should be prepared to recognize that potential need.

c. Cause for Skepticism.—Though we don't question the conviction of the proponents of this proposed federal act as to the rightness of their solution, past experience with massive federal programs entitles us to voice some skepticism. For example, we launched into Medicare and Medicaid without an adequate exploration and testing to ascertain the cost implications; the impact on the delivery of health, etc. The program is now being devoured by expenses, the demand on medical facilities has skyrocketed, and now a few short years later persons are advocating scrapping these programs and launching into something else. In conjunction with national health plans it has been said:

"There must be a critical review not only of the estimated cost of such proposals but with the financing mechanisms as well as with the services which are expected to be provided. At the moment, in the rush to design these new proposals, it appears to be forgotten that the planners of Medicare and Medicaid grossly underestimated the cost of these programs. They also gave little heed to the existing shortage of health manpower facilities which had been seriously aggravated by these new programs."¹⁶

This observation could apply with equal force to the proposals for federal automobile insurance reform. Forecasts as to the costs of this system are necessarily conjectural. It is only by a process of trial and error that the public will ascertain the true costs and only by experimental efforts at the state level can the best solution be found and earlier mistakes more readily rectified before they assume unmanageable proportions.

This example, as well as other examples which could be named, is not cited in criticism of the results which were sought but rather as an example of what occurs when massive federal involvement and planning on a nationwide uniform basis in complex areas precedes or supersedes the market mechanism as an allo-

¹³ *Id* at 61.

¹⁴ E.g. over the past decade, doctors' fees and hospital daily service charges increased 58% and 155% respectively. *Id* at 61.

¹⁵ NAIC report, note 2 *supra* 103.

¹⁶ Wheatley, "Promises and Problems of National Health Insurance," an address before the American Pension Conference, N.Y., N.Y., March 1971.

cator of economic resources. Original concepts which were so convincingly put forth have often proved to be wrong, but the adverse consequences of the error have been "frozen in" over a period of time.

Let's avoid making a similar mistake as to automobile insurance, which involves 100 million automobile drivers and nearly all American families. This is the message Secretary Volpe is conveying when he emphasizes the need for experimentation. Certainly the Ontario Experience—where motorist rejected coverage combining the fault and no-fault concepts put forth on a voluntary basis—should give one pause in mandating a fixed uniform standard on a nationwide basis.

d. *Federal Guidelines.*—Although we support the state-by-state approach of the Administration, we do have reservations concerning the adoption of federal guidelines or objectives such as those in the proposed concurrent resolution. Such standards, in addition to the concern previously mentioned above as to the creation of certain expectations, tend to prejudge what the market place has not yet passed upon—e.g., the choice of an essentially no fault over a reformed fault system, the determination that automobile insurance should be the primary coverage, etc. Such standards tend to restrict the range in which proposed changes would fall and hence the range of consumer choice. This does not say that the choices implicit in the standards proposed are incorrect but rather they are premature. If there are to be minimum federal standards, we feel that broader standards which give greater meaning to experimentation should be adopted. The minimum criteria for any automobile insurance system as stated by the NAIC in its Statement of Position on Automobile Insurance could be a sample of the kind of federal standards that would be meaningful.¹⁷ Nevertheless, a resolution by Congress expressing both the need and its will for prompt state action in exploring, testing and implementing improvements in the existing system would be an appropriate indication of the sense of Congress. This would serve notice on both the business and the states that progress is expected.

5. A TIME FOR CHANGE AND CURRENT MOMENTUM

All of this is not to argue for the status quo, nor to minimize the impact of the landmark DOT study, congressional hearings, academic works, state insurance departments' efforts and NAIC research. Quite to the contrary, each of these have significantly contributed to the emerging consensus that improvements are needed and have pointed out possible directions which should be considered and tested. Furthermore, the NAIC supports the Administration's position of recognizing not only the worth but the virtual necessity of a state-by-state approach until a clearer picture emerges as to the right answers—an answer which may vary from state to state or region to region.

To some proponents of the Uniform Motor Vehicle Insurance Act, the state-by-state approach is tantamount to doing nothing. This is incorrect. In addition to the "prod" from Congress in the form of a Congressional resolution, the states are receiving the same pressures for change that Congress receives. Few if any argue for the status quo. The basic research study is done. As of the early part of this month, we understand that no less than 28 states are now considering no fault or modified no fault legislation. (Other states have created study commissions. Some may be waiting to capitalize on the experimentation of others and others no doubt are waiting to see if Congress is going to preempt the field or give the states time to act.) The proposals range from the complete no fault program of the American Automobile Insurance Association to those which primarily seek to improve the existing legal liability system such as the American Trial Lawyer's Reform package with all sorts of variations in between.

¹⁷ "Whatever is decided as to the appropriate legal framework, the NAIC believes that any action on the insurance system should include as a minimum the following elements:

"A. ready access to insurance for all licensed drivers at prices which are reasonable, with a means to purchase insurance through an assigned risk mechanism for those who cannot purchase it in the voluntary market.

"B. prompt and prompt payment of basic economic loss and improved claims procedures.

"C. provision for protection from insolvencies, uninsured motorists and hit-and-run drivers, etc.

"D. meaningful classifications which are broad enough to spread risks and yet not so broad as to lessen availability of coverage.

"E. a responsive and meaningful pricing and marketing system.

"F. protection for the insured against arbitrary and unfair cancellation and nonrenewal.

"G. full disclosure of the nature of the coverage to the purchaser."

Secretary Volpe, in his statement before the Senate Commerce Committee, said: "Further change in the auto reparation system at the state level has clearly moved off dead center and would appear to be achieving some momentum. I could not have made that statement a year ago. I think this constructive move should be encouraged, perhaps guided and helped but not preempted by federal action."¹⁵

The activities mentioned above support the basis for the Secretary's beliefs and clearly demonstrate the heightened momentum. At this point, with so many different and sometimes conflicting ideas "floating around," and so much uncertainty as to what should be done, it is too early to predict what the states will and will not do. But events are moving sufficiently so, in our judgment, to warrant giving the states an adequate opportunity to act. If past experience is any guide, a variety of approaches will be tested and the best features of the various programs will emerge. At that point, the trend will be towards a more uniform system throughout the various states.

Of course, during the period of experimentation, we would be going through a phase when a number of different plans would be used in a number of different states. America is a mobile nation. Complications can be expected in the administration of a system as significant portions of the public journey across state lines. During this period, insurers operating across state border will have to provide for the variations in coverage through appropriate endorsements. It will present some administrative problems for the insurers and regulatory problems for the states. But this is a small price to pay compared to the damage which could occur if an ill-considered national program was imposed upon the nation in one installment from the top.

6. FEDERAL REGULATORY INTERVENTION

Although most attention on the proposed Uniform Motor Vehicle Insurance Act has focused on the mandating of the no fault concept, the Act poses another fundamental issue—i.e. state versus federal regulation of automobile insurance. There can be no mistake as to the pervasive regulatory power vested in the Secretary of Transportation. For example, the Secretary would (1) determine and approve the financial substitutes for insurance (i.e. bonds, self insurance), (2) determine by rules and regulations the percentage of responsibility for net economic loss assigned to motor vehicles larger than ordinary passenger cars, (3) approve policy terms, conditions, exclusions, and deductibles, (4) promulgate a uniform statistical plan for compilation of claims and loss experience which every insurer must follow, (5) require standard uniform and standard minimal policy provisions, classes of risks, and rating territories, (6) prescribe rules and regulations under which insurers would submit premiums being charged for each class of risk in each rating territory, (7) make available a comparison of insurers' rates based upon claim and loss experience, (8) organize an assigned claims bureau in each state, and (9) make, amend, and repeal rules and regulations as he deems necessary.

Under existing state law, the insurance department possesses comprehensive regulatory authority over insurers doing business therein. For example, state regulation encompasses these elements: (1) the incorporation of companies (qualifications, capital and surplus requirements, etc.), (2) the specification of required reserves, (3) the specifications of the areas in which insurance assets may be invested, (4) the approval of policy forms, (5) the supervision or monitoring of rates (for adequacy, excessiveness and non-discrimination), (6) the collection of statistics and the making of reports, (7) the examination of companies to determine if reserves are adequate, investments comply with the law, claim practices are satisfactory, etc. (8) the licensing and supervision of those who sell insurance, and (9) provision for residual coverages such as the assigned risk plans.

The regulatory overlap is substantial and clear. Confusion, waste, an increasingly complex system, and extra cost to the taxpayer in administering the automobile insurance is bound to result. We submit that such a dual system is not in the public interest.

In this connection, it should be pointed out that the DOT report recognized that " * * the basic determinant of the size and nature of the compensation requirement, i.e., car crash losses, is almost entirely, if not completely, a function of outside forces—traffic law enforcement, safety measure, car design, driver licensing

¹⁵ Volpe's statement, note 7 supra at 4.

and education, highway design, etc. Loss costs, themselves, reflect the prices being charged in the market place for hospital and medical care, auto repair and replacement parts, legal services, the cost of vehicles, etc., and they, too, cannot be significantly influenced, at least directly, by the compensation mechanism."⁹

The NAIC earlier reached the same conclusion.

"(Traffic safety or the absence thereof, the economic climate within which automobile insurance functions and the legal system upon which it rests) have a fundamental impact on the cost and the operation of the automobile insurance system despite the fact that they are external to the system and not subject to that system's control. Nevertheless they comprise the framework within which the system functions. Although the insurance system has its defects, some of the basic problems are caused externally and can only be remedied outside the system. Congress, various federal agencies and administrations, the judicial system, the providers of medical services, the automotive industry, state activity or lack thereof in traffic safety, etc., all have contributed to the basic problems."¹⁰

Thus the insurance industry and the regulators thereof have had to function in a legal, social and economic environment not of its own choosing. The problems stemming from this environment should not be translated into discarding those operating within it as long as they commit themselves to adjust to a new environment when it comes about. The DOT report, at the outset, made this same point:

"The conclusions made about the present system and its operations should not be interpreted to reflect adversely on any of the participants. The subject under investigation was in fact the 'system' and not those who have tried to make it run and improve it. The conclusions are directed to the system."¹¹

Furthermore, the Administration in the proposed resolution stated that "the principal problems and abuses with respect to automobile insurance stem from the defects in the system for compensating accident victims . . . rather than from defects in the insurance institution or in its regulation by the several states . . ." Consequently, shifting to a federal regulatory mechanism (even if federal guidelines or objectives are adopted) is not warranted nor recommended by the comprehensive studies made. As indicated earlier, the state insurance regulating mechanism has no vested interest other than its commitment to meeting the public needs in the extent to which the tort liability system is modified or eliminated. We regulate the providing of insurance now and can continue to do so on either a fault or no fault basis on either basis.

7. A PRACTICAL NOTE

As has been aptly pointed out elsewhere and referred to in this statement, inflation has been the prime cause in rate increases. Thus the basic responsibility for the problem generated rests in Washington. Public expenditures, increase in governmental activities, deficits, monetary policy, taxation, etc., all (with the exception of monetary policy) under the control of Congress largely determines the presence or absence of inflation.

This is not to say that improvements cannot or should not be made in the insurance mechanism at the state level. They should be made and they are being made. But the respite will only be temporary if inflation continues to take its inexorable toll. Efforts by Congress to deal with inflation, often hampered by political considerations, have not been effective thus far and there is national pessimism about the likelihood of any improvement in the picture.

8. SUMMARY

The basic issue with which we are confronted is the appropriate means to test and implement the no fault concept as it applies to motor vehicle insurance. Whether or not this concept or some variation should be adopted is a question of public policy which extends beyond the traditional confines of insurance and the regulation thereof. Whatever the decision, however, the state insurance departments have and continue to be prepared to regulate in the public interest.

This whole question involves a host of complex factors, conflicting objectives and a multiplicity of alternatives. As the DOT report documented, the public

⁹ DOT Report, p. 15.

¹⁰ Report of the NAIC Special Committee on Automobile Insurance Problems, 15 (June 1969).

¹¹ DOT Report, p. 15.

attitudes, and understandably so, are confused and "mixed." As a consequence, the NAIC opposes the enactment of the proposed no fault legislation on a federal national level and recommends experimentation on a state by state basis to resolve the problems posed in a manner responsive to the public's choice in the market place reflecting its balance between benefits it wants at costs it is willing to pay. A Congressional mandate as to mandatory and uniform coverage would destroy flexibility, freeze in error and preclude choice and self determination. Massive federal involvement, particularly in light of the substantial cost implications, would seem to be premature. Similarly we express reservations as to the establishment of federal guidelines or objectives since these would prejudice what the market has not yet passed upon and would tend to inhibit the range of consumer choice.

These comments are not to argue for the status quo nor against the no fault concept set out in the proposed legislation. We agree that some change is needed, although the extent is subject to debate. The NAIC supports utilizing the state by state approach to ascertain the best plan or plans. This process is already well underway as indicated by the already extensive activity at the state level.

Furthermore, the NAIC opposes legislation which interjects an extensive federal regulatory mechanism over automobile insurance. Such would create duplicatory regulation, confusion and unnecessary taxpayer expenses. Both Secretary Volpe's statement and the comprehensive DOT study clearly indicate that such intervention is not warranted so long as the states can continue to adjust to the changing environment. Furthermore, the proposed statute with its mandatory uniformity and inflexibility would turn back the clock 25 years to re-create what the antitrust laws and the Senate Antitrust and Monopoly Subcommittee have attempted to discourage these past many years.

In short, the NAIC endorses the Administration's positions of experimenting with different approaches at the state level. If Congress believes that some type of Congressional action is necessary, we feel that the resolution approach is the most appropriate. However, the inclusion of specific federal standards in such a resolution would be premature and would intend to inhibit the wide range of experimentation which it seeks to achieve. On the other hand, the resolution could express the "sense of Congress" by pointing out the problems, taking cognizance of the various studies and conflicting objectives and calling upon the states, the industry and other interested parties to develop and test solutions within a reasonable period of time, such as five years. Failure to do so could be construed as an invitation for Congress to undertake the task.

OREGON LEGISLATIVE ASSEMBLY—1971 REGULAR SESSION

HOUSE BILL 1299

Sponsored by COMMITTEE ON STATE AND FEDERAL AFFAIRS (at the request of the Insurance Commissioner's Special Advisory Committee on Auto Insurance)

SUMMARY

The following summary is not prepared by the sponsors of the measure and is not a part of the body thereof subject to consideration by the Legislative Assembly. It is an editor's brief statement of the essential features of the measure as introduced.

Declares that making of advance payments in personal injury and property damage cases is not admission of legal liability for injury or damage. Prevents suspension of statute of limitation in such cases if appropriate notice is given. Provides for reduction of amount of any judgment obtained by person to whom advance payments were made, in amount of such advance payments.

NOTE: Matter in bold face in an amended section is new; matter [*italic and bracketed*] is existing law to be omitted; complete new sections begin with section.

Be It Enacted by the People of the State of Oregon:

A BILL FOR AN ACT Relating to damages for death, injury or destruction

SECTION 1. As used in this Act, "advance payment" means compensation for the injury or death of a person or the injury or destruction of property prior to the determination of legal liability therefor.

CHURCH LEGISLATIVE ASSEMBLY—1971 REGULAR SESSION

HOUSE BILL 1300

STANDING COMMITTEE ON STATE AND FEDERAL AFFAIRS (at the
request of the Insurance Commissioner's Special Advisory Committee on
Auto Insurance).

SUMMARY

The following summary is not prepared by the sponsors of the measure and is not a part of the body thereof subject to consideration by the Legislative Assembly. It is an editor's brief statement of the essential features of the measure as introduced.

Requires insurers issuing automobile liability policies to provide minimum medical payments and loss of income benefits. Authorizes deduction of certain duplicate benefits from such coverages. Provides for reimbursement of benefits between insurers and arbitration of liability and amount of reimbursement. Effective January 1, 1972.

NOTE: Matter in bold face in an amended section is new; matter [*italic and bracketed*] is existing law to be omitted; complete new sections begin with section.

A BILL FOR AN ACT Relating to motor vehicle insurance benefits; creating new provisions; amending ORS 731.418 and 743.786; and prescribing an effective date

Be It Enacted by the People of the State of Oregon:

SECTION 1. Sections 2 to 9 of this Act are added to and made a part of ORS 743.786 to 743.792.

SEC. 2. Every motor vehicle liability policy issued or delivered in this state that covers any private passenger motor vehicle shall provide to the person insured thereunder and members of his family residing in the same household injured in a motor vehicle accident, guest passengers injured while occupying the insured motor vehicle and pedestrians struck by the insured motor vehicle, the following hospital, medical and disability benefits for each accident:

(1) All reasonable and necessary expenses for medical, hospital, dental, surgical, ambulance and prosthetic services incurred within one year after the date of the accident, in the amount of \$3,000 per person; and

(2) If the injured person is usually engaged in a remunerative occupation, 85 percent of the loss of income from work during the period commencing 14 days after the date of the accident and ending on the date the injured person is able to return to his usual occupation; or

(3) If the injured person is not usually engaged in a remunerative occupation, the expenses reasonably incurred for essential services in lieu of those the injured person would have performed without income during the period commencing 14 days after the date of the accident and ending on the date the injured person is reasonably able to perform such essential services.

(4) As used in this section, "income" includes but is not limited to salary, wages, tips, commissions, professional fees, and profits from an individually owned business or farm.

SEC. 3. (1) With respect to the insured and members of his family residing in the same household, an insurer may offer deductible forms up to \$250, of coverage for the benefits required by subsection (1) of section 2 of this 1971 Act.

(2) Notwithstanding section 2 of this 1971 Act:

(a) The benefits referred to in subsection (2) of section 2 of this 1971 Act need not exceed \$500 per month or be paid for a period exceeding 52 weeks.

(b) The benefits referred to in subsection (3) of section 2 of this 1971 Act need not exceed \$12 per day or be paid for a period exceeding 52 weeks.

(3) All benefits required by section 2 of this 1971 Act shall be paid promptly after proof of loss has been submitted to the insurer.

(4) The existence of a potential cause of action in tort that arises out of an accident does not relieve an insurer of the duty to pay the benefits to the injured person as required by section 2 of this 1971 Act.

SEC. 4. The benefits required by section 2 of this 1971 Act, with respect to:

(1) Injuries to the insured and members of his family residing in the same household shall be primary, but such benefits may be reduced or eliminated if they are similarly provided under another motor vehicle liability policy that covers the injured person, or if the injured person is entitled to receive under the laws of this state or any other state of the United States, workmen's compensation benefits or any other similar medical or disability benefits.

(2) Guest passengers injured while occupying the insured motor vehicle, and with respect to pedestrians injured by the insured motor vehicle, may be excess over any other collateral benefits to which the injured person is entitled, including but not limited to insurance benefits, governmental benefits or gratuitous benefits.

Administration has tentatively endorsed the no fault concept, it has concluded that mere speculation without actual observation of experience with a new plan is an inadequate basis for massive, uniform national reform; and that the federal assumption of the current state regulatory authority over automobile insurance poses great issues and consequences and is highly undesirable.² The Administration recommends that solutions, built upon specified general principles, evolve at the state level to permit experimentation and testing of different approaches. *Thus the basic issue is joined—i.e. what is the most appropriate approach to test and/or implement the no fault concept.*

2. NAIC POSITION ON THE NO FAULT CONCEPT

At the outset, let me indicate the perspective from which the NAIC, as an association of state insurance regulators, views the fault versus no fault concept. The tort liability system is a legal system which is separate and distinct from the automobile insurance system. When the first automobile insurance policy was written prior to 1900, the fault concept was well embedded. The automobile insurance system, and the regulation thereof, of necessity, has in large part been engrafted on and molded by the broader legal environment in which it finds itself. As a consequence, automobile insurance was originally premised on the concept of protecting a person from economic disaster resulting from legal liability—by defending against claims and paying those adjudged to be valid. Only incidentally was the combination of the legal and insurance systems thought of in terms of providing reparation to the victim. In more recent years, there has been a shift in concept. Increasing attention has been focused on the plight of the victim. The inquiry now centers on how dependent upon fault the reparation system should be.

Obviously, the questions being posed extend far beyond the interests of automobile insurance and its regulation. Numerous groups are interested in the ultimate result. These include the policyholder, the claimants, the legal profession, the providers of medical services, insurers, agents, unions, etc. Because of the many groups involved, the extensive diversity within such groups, and the complexity of the issues involved, a wide range of conflicting attitudes and objectives exists. The NAIC, following a comprehensive background study by its Central Office staff, adopted a position statement which, among other things, said that question of fault versus non fault "is an issue involving wide spread ramifications far beyond the traditional confines of insurance regulation * * * The decision as to whether the present system should be reformed is not a legal decision nor is it a statistical one: *it is a question of values.*"

"Thus the type of system adopted is a broad question of public policy.

"The NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis."³

Our responsibility as regulators is a limited one. If private enterprise is chosen as the implementing mechanism (whether the third party legal system is retained, modified, or eliminated), our function would continue to be regulation in the interest of a sound, efficient, and equitable system on behalf of the insurance consuming public.

Incidentally, state insurance regulation has no vested interest in either eliminating or continuing the third party legal liability system for automobile insurance. We currently oversee both fault and no fault type coverages. What is ultimately in the best interest of the public is what we favor and support. The problem is determining what is ultimately in the public interest.

3. THE STATE-BY-STATE APPROACH

While we as insurance regulators will not be the ultimate arbiters as to what constitutes the most appropriate reparation system in terms of public policy objectives, we do occupy a unique vantage point for observing the existing system. State insurance departments regulate insurers, examine their operations, approve policy forms, review policyholder and claimholder complaints, and re-

² H.R. Conference Report 241, 92d Congress, 1st Sess. (1971).

³ NAIC Statement of Position on Automobile Insurance, *Report of the Special Committee on Tort Liability Coverage Problems*, June 16, 1969, p. 17. The report was adopted by the NAIC in June 1969. In addition, the report contains the staff background study. A copy of the report is submitted for the record.

spond to all manner of consumer needs. Consequently, we have a continuing opportunity to closely observe the workings of the insurance mechanism and to do so from the public's viewpoint. Thus, in this sense, as well as from reviewing the studies made by the NAIC, DOT and individual insurance departments, we feel our observations will contribute to your deliberations.

The fault versus no fault concept poses numerous complex and difficult issues. Among the factors requiring primary consideration are finding a means to assure that payments are made promptly, that the distribution of claims payments is an equitable one, and that a greater percentage of each premium dollar is paid out to victims.

In addition, consideration must be given to: overlapping coverages and premiums, flexibility, and impact on rehabilitation. Implicit in these factors are conflicting attitudes and objectives. Public clamor over increased automobile insurance premiums has significantly added to the pressure for change. Proponents of no fault are urging that virtually all injuries be compensated regardless of fault. These are conflicting objectives—i.e. lower cost versus increased benefits. Thus a basic question becomes what benefits the public wants, what benefits the public is willing to forego, and what cost level the public is willing to accept.

The final report of the Department of Transportation, as well as Secretary Volpe's presentation, highlighted the multiplicity of options confronting us and the need for experimentation. For example, the report named six basic areas of consideration, each area involving numerous subconsiderations within itself: (1) the legal rule governing reparations, (2) the role of insurance, (3) the kinds of losses to be compensated, (4) private versus social insurance, (5) compulsory versus voluntary insurance, and (6) insurance and the loss minimization objective.³ Alternative approaches raised include (1) retain the status quo, (2) improve the present tort legal liability system (e.g. judicial reform, shift to comparative negligence, regulate contingency fees, etc.), (3) rely on evolutionary reform by combining fault and no fault coverages, (4) establish a total no fault system, and (5) utilize government insurance.⁴

In spite of the mass of research conducted, the general public has no clear concept of what is involved or the ramifications posed by the various alternative methods. The DOT report's section on public opinion makes this quite obvious:

"In general, these surveys indicate that the public has mixed attitudes about the performance of various aspects of the system, is generally ill-informed about the current system, and, on the whole, shows an openness to change when made aware of alternatives to the present system."⁵ (Emphasis supplied.)

In short, a clear and informed consensus has not yet emerged.

With these and other factors in mind, the NAIC has said:

"Because factors, concepts, values, and attitudes vary from locale to locale, this public policy decision can best be made on a state-by-state basis rather than at the federal level. This, in turn, affords the opportunity to test and experiment with different approaches on a limited basis. After a period of experience with different plans, the better solution(s) will emerge. The NAIC therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis. Whatever the system, the various state insurance regulators can regulate for the public interest most effectively because of the varied needs of a differing populace in the several states. The public, by its responses to legislation and by the decisions it makes in the market place in accepting or rejecting various coverages and services offered, will ultimately settle the issue."⁶ (Emphasis supplied)

This remains the judgment of the NAIC. Furthermore, it has been subsequently fortified by both Secretary Volpe's statement before the Senate Commerce Committee⁷ and by the DOT report which said:

³ See DOT, *Motor Vehicle Crash Losses and their Compensation in the United States*: a Report to the President and Congress 101-111 (March 1971) (hereafter cited as the DOT Report).

⁴ See *id.* at 112-127.

⁵ *Id.* at 81.

⁶ NAIC Statement of Position, note 2 *supra* at 17.

⁷ "Nor will I attempt to assess here the relative merits of all the various reform plans that have been offered as alternatives to the present system. In this thicket, there is plainly much less of a consensus: the complexity of the subject and its problems make possible an almost limitless number of combinations, permutations and variations of recovery rules, insurance coverages, etc." Statement of Secretary of Transportation John A. Volpe before the Senate Commerce Committee, March 18, 1971, p. 2.

"Moving in stages toward such a goal would allow us to test its virtues and discover its faults, thereby giving us new knowledge that could serve to modify the goal itself. A little observation is worth a great deal of speculation, and State experience with diverse plans will provide us with that opportunity for pilot project testing which must precede massive reform."⁸

Furthermore, Secretary Volpe said:

"First, it seems clear, at least to us, that *there remains much legitimate uncertainty about how far and how fast the public wants or is willing to go in changing the reparations system.* It is also clear that *there exists genuine and warranted concern as to the unknown and essentially unknowable price and cost implications of any major change in the system,* which of course would ultimately affect the cost and quality of service to consumers of insurance. Regulators and other responsible public officials would appear to share these feelings. We, ourselves, don't claim to have definite answers to these questions either. As a result, it seems to us that we should seek change through State action, but consistent with the broad outlines or principles of a system such as that described below. We need not and do not insist that a single reform system be imposed upon all the States. The experience of the States should have much to tell us about the most desirable final configuration of the motor vehicle reparations system."⁹ (Emphasis supplied)

In brief, we simply don't know at this point what the answer or combinations of answers are. With all due respect to the advocates of the federal no-fault plan, we submit that no one knows the answers to these questions (and others which could be posed)—and until we do, no one knows what final form a national program should take.

4. CAVEATS ON FEDERAL MANDATED STANDARDS AND VOLUNTARY GUIDELINES

Secretary Volpe urged that change commence now and the Administration is supporting a joint concurrent resolution putting the states on notice that they are expected to resolve this problem within a reasonable period of time. We don't disagree that some change is needed, although the magnitude or direction of change is subject to intense debate.

a. *Immediate Uniform Massive Change is Premature.*—At the one extreme the proposed Uniform Motor Vehicle Insurance Act would establish rigid statutory standards as to what must be in an automobile insurance policy. Such an approach has the practical effect of destroying flexibility and tends to freeze in limitations in coverage.¹⁰ Perhaps even worse, the uniformity imposed would preclude the consuming public from the opportunity to register its choice over a meaningful period of time and thereby make the insurance mechanism responsible to the public's evolving concept as to the appropriate balance between benefits and costs.

b. *The Cost Factor.*—No matter how hard we try, it is either impossible or foolhardy to ignore the ramifications of the cost of any given program or alternative. As the NAIC staff study pointed out:

"In appraising the worth of any system, a very important consideration is the cost of such system as compared to the cost of possible alternatives. Public clamor over increasing automobile insurance premium levels has significantly added to the pressure for change.

"... the NAIC strongly supports efforts to reduce the cost of automobile insurance to the public to the extent that such reductions are consistent with other major objectives. It must be remembered that no program can meet all demands since the demands themselves are frequently in conflict. It is virtually impossible to pay more accident victims more dollars and reduce costs at the same time. Thus, whatever changes are recommended they should be evaluated with a view towards the best balance possible between *conflicting objectives and particularly between the objectives of increased benefits and cost savings.*"¹¹ (Emphasis supplied)

As the DOT report noted, "consumer attitudes about automobile insurance have shown its cost to lead all other concerns."¹² Consequently any program

⁸ DOT Report, p. 133.

⁹ Volpe's statement, note 7 supra at 3.

¹⁰ The chief advantage of a standard policy is that it facilitates prior comparisons. In the past, uniform terms have often led to uniform and non-competitive prices. Competition in policy terms usually leads to more innovative contrasts and broader terms.

¹¹ NAIC Report, note 2 supra at 103.

¹² DOT Report at 138.

which does not afford the consumer an opportunity to relate the benefits he desires to the costs he must pay may create more public dissatisfaction than it eliminates.

This point is particularly relevant to a program such as automobile insurance whose costs are bound to increase. The DOT report has recognized:

"Perhaps the most pervasive influence upon automobile insurance as a public issue in recent years has been inflation."¹³

In effect, an automobile insurance company is a mass purchaser of a variety of goods and services such as medical, hospital, lawyer and court services, wage replacements, repair goods and services, etc. As the cost of these elements increase, the cost of insurance must do the same.¹⁴

"If such costs continue to inflate (and there is little reason to hope otherwise), initial cost savings resulting from changing the system would soon be forgotten and public frustration with costs would arise anew. This suggests that, while efficiencies in the system are important, drastic changes aimed at reducing premium levels (or lessening increases) may result in only temporary relief."¹⁵

Much of the American motoring public is being led to believe that no fault is a panacea, bringing with it broader coverage, payment in all cases, and lower costs. The idea that something must be given up in order to get something else back has not yet registered in many quarters. The passage of the proposed legislation, without a preliminary period of trial and error during which the public would become educated as to its advantages and disadvantages and would be able to relate its wants to its costs by choice in the free market, could set the stage for massive public disenchantment with all who were connected with its enactment.

The establishment of minimum mandatory benefits, such as those being discussed, in a federal statute poses far reaching, long-term ramifications. In fact, the same can be said, although perhaps to a lesser extent, as to the establishment of federal guidelines to which the states should strive since such guidelines would tend to become the minimum norm of consumers' expectations as to what they are "entitled to: by right."

If the cost of such benefits exceeds what the public is willing to pay, federal subsidies may be necessary and you should be prepared to recognize that potential need.

c. Cause for Skepticism.—Though we don't question the conviction of the proponents of this proposed federal act as to the rightness of their solution, past experience with massive federal programs entitles us to voice some skepticism. For example, we launched into Medicare and Medicaid without an adequate exploration and testing to ascertain the cost implications; the impact on the delivery of health, etc. The program is now being devoured by expenses, the demand on medical facilities has skyrocketed, and now a few short years later persons are advocating scrapping these programs and launching into something else. In conjunction with national health plans it has been said:

"There must be a critical review not only of the estimated cost of such proposals but with the financing mechanisms as well as with the services which are expected to be provided. At the moment, in the rush to design these new proposals, it appears to be forgotten that the planners of Medicare and Medicaid grossly underestimated the cost of these programs. They also gave little heed to the existing shortage of health manpower facilities which had been seriously aggravated by these new programs."¹⁶

This observation could apply with equal force to the proposals for federal automobile insurance reform. Forecasts as to the costs of this system are necessarily conjectural. It is only by a process of trial and error that the public will ascertain the true costs and only by experimental efforts at the state level can the best solution be found and earlier mistakes more readily rectified before they assume unmanageable proportions.

This example, as well as other examples which could be named, is not cited in criticism of the results which were sought but rather as an example of what occurs when massive federal involvement and planning on a nationwide uniform basis in complex areas precedes or supersedes the market mechanism as an allo-

¹³ *Id* at 61.

¹⁴ E.g. over the past decade, doctors' fees and hospital daily service charges increased 58% and 155% respectively. *Id* at 61.

¹⁵ NAIC report, note 2 *supra* 103.

¹⁶ Wheatley, "Promises and Problems of National Health Insurance," an address before the American Pension Conference, N.Y., N.Y., March 1971.

cator of economic resources. Original concepts which were so convincingly put forth have often proved to be wrong, but the adverse consequences of the error have been "frozen in" over a period of time.

Let's avoid making a similar mistake as to automobile insurance, which involves 100 million automobile drivers and nearly all American families. This is the message Secretary Volpe is conveying when he emphasizes the need for experimentation. Certainly the Ontario Experience—where motorist rejected coverage combining the fault and no-fault concepts put forth on a voluntary basis—should give one pause in mandating a fixed uniform standard on a nationwide basis.

d. *Federal Guidelines.*—Although we support the state-by-state approach of the Administration, we do have reservations concerning the adoption of federal guidelines or objectives such as those in the proposed concurrent resolution. Such standards, in addition to the concern previously mentioned above as to the creation of certain expectations, tend to prejudice what the market place has not yet passed upon—e.g., the choice of an essentially no fault over a reformed fault system, the determination that automobile insurance should be the primary coverage, etc. Such standards tend to restrict the range in which proposed changes would fall and hence the range of consumer choice. This does not say that the choices implicit in the standards proposed are incorrect but rather they are premature. If there are to be minimum federal standards, we feel that broader standards which give greater meaning to experimentation should be adopted. The minimum criteria for any automobile insurance system as stated by the NAIC in its Statement of Position on Automobile Insurance could be a sample of the kind of federal standards that would be meaningful.¹⁷ Nevertheless, a resolution by Congress expressing both the need and its will for prompt state action in exploring, testing and implementing improvements in the existing system would be an appropriate indication of the sense of Congress. This would serve notice on both the business and the states that progress is expected.

5. A TIME FOR CHANGE AND CURRENT MOMENTUM

All of this is not to argue for the status quo, nor to minimize the impact of the landmark DOT study, congressional hearings, academic works, state insurance departments' efforts and NAIC research. Quite to the contrary, each of these have significantly contributed to the emerging consensus that improvements are needed and have pointed out possible directions which should be considered and tested. Furthermore, the NAIC supports the Administration's position of recognizing not only the worth but the virtual necessity of a state-by-state approach until a clearer picture emerges as to the right answers—an answer which may vary from state to state or region to region.

To some proponents of the Uniform Motor Vehicle Insurance Act, the state-by-state approach is tantamount to doing nothing. This is incorrect. In addition to the "prod" from Congress in the form of a Congressional resolution, the states are receiving the same pressures for change that Congress receives. Few if any argue for the status quo. The basic research study is done. As of the early part of this month, we understand that no less than 28 states are now considering no fault or modified no fault legislation. (Other states have created study commissions. Some may be waiting to capitalize on the experimentation of others and others no doubt are waiting to see if Congress is going to preempt the field or give the states time to act.) The proposals range from the complete no fault program of the American Automobile Insurance Association to those which primarily seek to improve the existing legal liability system such as the American Trial Lawyer's Reform package with all sorts of variations in between.

¹⁷ "Whatever is decided as to the appropriate legal framework, the NAIC believes that any automobile insurance system should include as a minimum the following elements:

"A. ready access to insurance for all licensed drivers at prices which are reasonable, with a means to purchase insurance through an assigned risk mechanism for those who cannot purchase it in the voluntary market;

"B. provision for prompt payment of basic economic loss and improved claims procedures;

"C. provision for protection from insolvencies, uninsured motorists and hit-and-run drivers, etc.

"D. meaningful classifications which are broad enough to spread risks and yet not so broad as to lessen availability of coverage;

"E. a responsive and meaningful pricing and marketing system;

"F. protection for the insured against arbitrary and unfair cancellation and nonrenewal;

"G. full disclosure of the nature of the coverage to the purchaser."

Secretary Volpe, in his statement before the Senate Commerce Committee, said: "Further change in the auto reparation system at the state level has clearly moved off dead center and would appear to be achieving some momentum. I could not have made that statement a year ago. I think this constructive move should be encouraged, perhaps guided and helped but not preempted by federal action."¹⁸

The activities mentioned above support the basis for the Secretary's beliefs and clearly demonstrate the heightened momentum. At this point, with so many different and sometimes conflicting ideas "floating around," and so much uncertainty as to what should be done, it is too early to predict what the states will and will not do. But events are moving sufficiently so, in our judgment, to warrant giving the states an adequate opportunity to act. If past experience is any guide, a variety of approaches will be tested and the best features of the various programs will emerge. At that point, the trend will be towards a more uniform system throughout the various states.

Of course, during the period of experimentation, we would be going through a phase when a number of different plans would be used in a number of different states. America is a mobile nation. Complications can be expected in the administration of a system as significant portions of the public journey across state lines. During this period, insurers operating across state border will have to provide for the variations in coverage through appropriate endorsements. It will present some administrative problems for the insurers and regulatory problems for the states. But this is a small price to pay compared to the damage which could occur if an ill-considered national program was imposed upon the nation in one installment from the top.

6. FEDERAL REGULATORY INTERVENTION

Although most attention on the proposed Uniform Motor Vehicle Insurance Act has focused on the mandating of the no fault concept, the Act poses another fundamental issue—i.e. state versus federal regulation of automobile insurance. There can be no mistake as to the pervasive regulatory power vested in the Secretary of Transportation. For example, the Secretary would (1) determine and approve the financial substitutes for insurance (i.e. bonds, self insurance), (2) determine by rules and regulations the percentage of responsibility for net economic loss assigned to motor vehicles larger than ordinary passenger cars, (3) approve policy terms, conditions, exclusions, and deductibles, (4) promulgate a uniform statistical plan for compilation of claims and loss experience which every insurer must follow, (5) require standard uniform and standard minimal policy provisions, classes of risks, and rating territories, (6) prescribe rules and regulations under which insurers would submit premiums being charged for each class of risk in each rating territory, (7) make available a comparison of insurers' rates based upon claim and loss experience, (8) organize an assigned claims bureau in each state, and (9) make, amend, and repeal rules and regulations as he deems necessary.

Under existing state law, the insurance department possesses comprehensive regulatory authority over insurers doing business therein. For example, state regulation encompasses these elements: (1) the incorporation of companies (qualifications, capital and surplus requirements, etc.), (2) the specification of required reserves, (3) the specifications of the areas in which insurance assets may be invested, (4) the approval of policy forms, (5) the supervision or monitoring of rates (for adequacy, excessiveness and non-discrimination), (6) the collection of statistics and the making of reports, (7) the examination of companies to determine if reserves are adequate, investments comply with the law, claim practices are satisfactory, etc. (8) the licensing and supervision of those who sell insurance, and (9) provision for residual coverages such as the assigned risk plans.

The regulatory overlap is substantial and clear. Confusion, waste, an increasingly complex system, and extra cost to the taxpayer in administering the automobile insurance is bound to result. We submit that such a dual system is not in the public interest.

In this connection, it should be pointed out that the DOT report recognized that " * * the basic determinant of the size and nature of the compensation requirement, i.e., car crash losses, is almost entirely, if not completely, a function of outside forces—traffic law enforcement, safety measure, car design, driver licensing

¹⁸ Volpe's statement, note 7 supra at 4.

and education, highway design, etc. Loss costs, themselves, reflect the prices being charged in the market place for hospital and medical care, auto repair and replacement parts, legal services, the cost of vehicles, etc., and they, too, cannot be significantly influenced, at least directly, by the compensation mechanism."¹⁰

The NAIC earlier reached the same conclusion.

"(Traffic safety or the absence thereof, the economic climate within which automobile insurance functions and the legal system upon which it rests) have a fundamental impact on the cost and the operation of the automobile insurance system despite the fact that they are external to the system and not subject to that system's control. Nevertheless they comprise the framework within which the system functions. Although the insurance system has its defects, some of the basic problems are caused externally and can only be remedied outside the system. Congress, various federal agencies and administrations, the judicial system, the providers of medical services, the automotive industry, state activity or lack thereof in traffic safety, etc., all have contributed to the basic problems."¹¹

Thus the insurance industry and the regulators thereof have had to function in a legal, social and economic environment not of its own choosing. The problems stemming from this environment should not be translated into discarding those operating within it as long as they commit themselves to adjust to a new environment when it comes about. The DOT report, at the outset, made this same point:

"The conclusions made about the present system and its operations should not be interpreted to reflect adversely on any of the participants. The subject under investigation was in fact the 'system' and not those who have tried to make it run and improve it. The conclusions are directed to the system."¹²

Furthermore, the Administration in the proposed resolution stated that "the principal problems and abuses with respect to automobile insurance stem from the defects in the system for compensating accident victims * * * rather than from defects in the insurance institution or in its regulation by the several states * * *". Consequently, shifting to a federal regulatory mechanism (even if federal guidelines or objectives are adopted) is not warranted nor recommended by the comprehensive studies made. As indicated earlier, the state insurance regulating mechanism has no vested interest other than its commitment to meeting the public needs in the extent to which the tort liability system is modified or eliminated. We regulate the providing of insurance now and can continue to do so on either a fault or no fault basis on either basis.

7. A PRACTICAL NOTE

As has been aptly pointed out elsewhere and referred to in this statement, inflation has been the prime cause in rate increases. Thus the basic responsibility for the problem generated rests in Washington. Public expenditures, increase in governmental activities, deficits, monetary policy, taxation, etc., all (with the exception of monetary policy) under the control of Congress largely determines the presence or absence of inflation.

This is not to say that improvements cannot or should not be made in the insurance mechanism at the state level. They should be made and they are being made. But the respite will only be temporary if inflation continues to take its inexorable toll. Efforts by Congress to deal with inflation, often hampered by political considerations, have not been effective thus far and there is national pessimism about the likelihood of any improvement in the picture.

8. SUMMARY

The basic issue with which we are confronted is the appropriate means to test and/or implement the no fault concept as it applies to motor vehicle insurance. Whether or not this concept or some variation should be adopted is a question of public policy which extends beyond the traditional confines of insurance and the regulation thereof. Whatever the decision, however, the state insurance departments have and continue to be prepared to regulate in the public interest.

This whole question involves a host of complex factors, conflicting objectives and a multiplicity of alternatives. As the DOT report documented, the public

¹⁰ DOT Report, p. 1v.

¹¹ Report of the NAIC Special Committee on Automobile Insurance Problems, 15 (June 1969).

¹² DOT Report, p. 1v.

attitudes, and understandably so, are confused and "mixed." As a consequence, the NAIC opposes the enactment of the proposed no fault legislation on a federal national level and recommends experimentation on a state by state basis to resolve the problems posed in a manner responsive to the public's choice in the market place reflecting its balance between benefits it wants at costs it is willing to pay. A Congressional mandate as to mandatory and uniform coverage would destroy flexibility, freeze in error and preclude choice and self determination. Massive federal involvement, particularly in light of the substantial cost implications, would seem to be premature. Similarly we express reservations as to the establishment of federal guidelines or objectives since these would prejudice what the market has not yet passed upon and would tend to inhibit the range of consumer choice.

These comments are not to argue for the status quo nor against the no fault concept set out in the proposed legislation. We agree that some change is needed, although the extent is subject to debate. The NAIC supports utilizing the state by state approach to ascertain the best plan or plans. This process is already well underway as indicated by the already extensive activity at the state level.

Furthermore, the NAIC opposes legislation which interjects an extensive federal regulatory mechanism over automobile insurance. Such would create duplicatory regulation, confusion and unnecessary taxpayer expenses. Both Secretary Volpe's statement and the comprehensive DOT study clearly indicate that such intervention is not warranted so long as the states can continue to adjust to the changing environment. Furthermore, the proposed statute with its mandatory uniformity and inflexibility would turn back the clock 25 years to recreate what the antitrust laws and the Senate Antitrust and Monopoly Subcommittee have attempted to discourage these past many years.

In short, the NAIC endorses the Administration's positions of experimenting with different approaches at the state level. If Congress believes that some type of Congressional action is necessary, we feel that the resolution approach is the most appropriate. However, the inclusion of specific federal standards in such a resolution would be premature and would intend to inhibit the wide range of experimentation which it seeks to achieve. On the other hand, the resolution could express the "sense of Congress" by pointing out the problems, taking cognizance of the various studies and conflicting objectives and calling upon the states, the industry and other interested parties to develop and test solutions within a reasonable period of time, such as five years. Failure to do so could be construed as an invitation for Congress to undertake the task.

OREGON LEGISLATIVE ASSEMBLY—1971 REGULAR SESSION

HOUSE BILL 1299

Sponsored by COMMITTEE ON STATE AND FEDERAL AFFAIRS (at the request of the Insurance Commissioner's Special Advisory Committee on Auto Insurance)

SUMMARY

The following summary is not prepared by the sponsors of the measure and is not a part of the body thereof subject to consideration by the Legislative Assembly. It is an editor's brief statement of the essential features of the measure as introduced.

Declares that making of advance payments in personal injury and property damage cases is not admission of legal liability for injury or damage. Prevents suspension of statute of limitation in such cases if appropriate notice is given. Provides for reduction of amount of any judgment obtained by person to whom advance payments were made, in amount of such advance payments.

NOTE: Matter in bold face in an amended section is new; matter [*italic and bracketed*] is existing law to be omitted; complete new sections begin with section.

Be It Enacted by the People of the State of Oregon:

A BILL FOR AN ACT Relating to damages for death, injury or destruction

SECTION 1. As used in this Act, "advance payment" means compensation for the injury or death of a person or the injury or destruction of property prior to the determination of legal liability therefor.

SEC. 2. (1) Advance payment made for damages arising from the death or injury of a person is not an admission of liability for the death or injury by the person making the payment unless the parties to the payment agree to the contrary in writing.

(2) For the purpose of subsection (1) of this section, advance payment is made with or to:

- (a) The injured person;
- (b) A person acting on behalf of the injured person with the consent of the injured person; or
- (c) Any other person entitled to recover damages on account of the injury or death of the injured or deceased person.

SEC. 3. Any advance payment made for damages arising from injury or destruction of property is not an admission of liability for the injury or destruction by the person making the payment unless the parties to the payment agree to the contrary in writing.

SEC. 4. No advance payment referred to in section 2 or 3 of this Act is admissible in evidence in any action for damages arising from a death, injury or destruction for which any such advance payment has been made.

SEC. 5. (1) If the person who makes an advance payment referred to in section 2 or 3 of this Act gives to each person entitled to recover damages for the death, injury or destruction, not later than 30 days after the date the first of such advance payments was made, written notice of the date of expiration of the period of limitation for the commencement of an action for damages set by the applicable statute of limitations, then the making of any such advance payment does not suspend the running of such period of limitation. The notice required by this subsection shall be in such form as the Insurance Commissioner prescribes.

(1) If the notice required by subsection (1) of this section is not given the time between the date the first advance payment was made and the date a notice is actually given of the date of expiration of the period of limitation for the commencement of an action for damages set by the applicable statute of limitations is not part of the period limited for commencement of the action by the statute of limitations.

SEC. 6. (1) If judgment is entered against a party on whose behalf an advance payment referred to in section 2 or 3 of this Act has been made and in favor of a party for whose benefit any such advance payment has been received, the amount of the judgment shall be reduced by the amount of any such payments in the manner provided in subsection (2) of this section. However, nothing in this Act authorizes the party on whose behalf advance payment has been made to recover such advance payment if no damages are awarded or to recover any amount by which the advance payment exceeds the award of damages.

(2) The amount of any advance payment made may be submitted by the party making the payment in the manner provided in ORS 20.210 and 20.220 for the submission of disbursements. Unless timely objections are filed as provided in ORS 20.210, the court clerk shall apply the amount of the advance payments claimed pursuant to this subsection in partial satisfaction of the judgment. Such partial satisfaction shall be allowed within regard to whether the party claiming the reduction is otherwise entitled to costs and disbursements in the action.

OREGON LEGISLATIVE ASSEMBLY—1971 REGULAR SESSION

HOUSE BILL 1290

Sponsored by COMMITTEE ON STATE AND FEDERAL AFFAIRS (at the request of the Insurance Commissioner's Special Advisory Committee on Auto Insurance)

SUMMARY

The following summary is not prepared by the sponsors of the measure and is not a part of the body thereof subject to consideration by the Legislative Assembly. It is an editor's brief statement of the essential features of the measure as introduced.

Requires insurers issuing automobile liability policies to provide minimum medical payments and loss of income benefits. Authorizes deduction of certain duplicate benefits from such coverages. Provides for reimbursement of benefits between insurers and arbitration of liability and amount of reimbursement. Effective January 1, 1972.

NOTE: Matter in bold face in an amended section is new; matter *[italic and bracketed]* is existing law to be omitted; complete new sections begin with section.

A BILL FOR AN ACT Relating to motor vehicle insurance benefits; creating new provisions; amending ORS 731.418 and 743.786; and prescribing an effective date

Be It Enacted by the People of the State of Oregon:

SECTION 1. Sections 2 to 9 of this Act are added to and made a part of ORS 743.786 to 743.792.

SEC. 2. Every motor vehicle liability policy issued or delivered in this state that covers any private passenger motor vehicle shall provide to the person insured thereunder and members of his family residing in the same household injured in a motor vehicle accident, guest passengers injured while occupying the insured motor vehicle and pedestrians struck by the insured motor vehicle, the following hospital, medical and disability benefits for each accident:

(1) All reasonable and necessary expenses for medical, hospital, dental, surgical, ambulance and prosthetic services incurred within one year after the date of the accident, in the amount of \$3,000 per person; and

(2) If the injured person is usually engaged in a remunerative occupation, 85 percent of the loss of income from work during the period commencing 14 days after the date of the accident and ending on the date the injured person is able to return to his usual occupation; or

(3) If the injured person is not usually engaged in a remunerative occupation, the expenses reasonably incurred for essential services in lieu of those the injured person would have performed without income during the period commencing 14 days after the date of the accident and ending on the date the injured person is reasonably able to perform such essential services.

(4) As used in this section, "income" includes but is not limited to salary, wages, tips, commissions, professional fees, and profits from an individually owned business or farm.

SEC. 3. (1) With respect to the insured and members of his family residing in the same household, an insurer may offer deductible forms up to \$250, of coverage for the benefits required by subsection (1) of section 2 of this 1971 Act.

(2) Notwithstanding section 2 of this 1971 Act:

(a) The benefits referred to in subsection (2) of section 2 of this 1971 Act need not exceed \$500 per month or be paid for a period exceeding 52 weeks.

(b) The benefits referred to in subsection (3) of section 2 of this 1971 Act need not exceed \$12 per day or be paid for a period exceeding 52 weeks.

(3) All benefits required by section 2 of this 1971 Act shall be paid promptly after proof of loss has been submitted to the insurer.

(4) The existence of a potential cause of action in tort that arises out of an accident does not relieve an insurer of the duty to pay the benefits to the injured person as required by section 2 of this 1971 Act.

SEC. 4. The benefits required by section 2 of this 1971 Act, with respect to:

(1) Injuries to the insured and members of his family residing in the same household shall be primary, but such benefits may be reduced or eliminated if they are similarly provided under another motor vehicle liability policy that covers the injured person, or if the injured person is entitled to receive under the laws of this state or any other state of the United States, workmen's compensation benefits or any other similar medical or disability benefits.

(2) Guest passengers injured while occupying the insured motor vehicle, and with respect to pedestrians injured by the insured motor vehicle, may be excess over any other collateral benefits to which the injured person is entitled, including but not limited to insurance benefits, governmental benefits or gratuitous benefits.

SEC. 5. (1) The insurer may exclude from coverage of the benefits required by section 2 of this 1971 Act any injured person:

(a) Whose injury resulted from an accident in which he is convicted of violating ORS 164.650, 164.670, subsection (1) of 482.040, ORS 482.650, 483.049 or subsection (2) of 483.992;

(b) Who intentionally causes injury to himself; or

(c) Who is participating in any prearranged or organized racing or speed contest or in practice or preparation for any such contest.

(2) The insurer may exclude from coverage of the benefits required by subsection (2) of section 2 of this 1971 Act any person injured in an accident outside this state if that injured person is not the named insured, a member of the named insured's family residing in his household or a guest passenger in motor vehicle owned or operated by the named insured.

SEC. 6. Nothing in this 1971 Act is intended to prevent an insurer from providing more favorable benefits than those required by section 2 of this 1971 Act.

SEC. 7. (1) Every insurer that transacts motor vehicle liability insurance, if its insured is or would be held legally liable for damages for injuries sustained by a person to whom benefits required by section 2 of this 1971 Act have been paid by another insurer, shall reimburse such other insurer for the benefits so paid in an amount not to exceed the damages so recoverable. Disputes between insurers as to the issues of liability for and the amount of the reimbursement required by this subsection shall be decided by arbitration.

(2) Findings and award made in an arbitration proceeding referred to in subsection (1) of this section are not admissible in any action at law or suit in equity.

SEC. 8. If an insurer has paid benefits required by section 2 of this 1971 Act to a claimant injured by a person who is not covered by a motor vehicle liability policy issued by an insurer authorized to issue such policies in this state:

(1) The insurer shall be entitled to the extent of such payment to the proceeds of any settlement or judgment that may result from the exercise of any rights of recovery of the claimant against any uninsured motorist legally responsible for the bodily injury because of which such payment is made;

(2) The claimant shall hold in trust for the benefit of the insurer all rights of recovery which he shall have against such uninsured person because of the damages which are the subject of claim made under this coverage, but only to the extent that such claim is made or paid herein;

(3) The claimant shall do whatever is proper to secure and shall do nothing after loss to prejudice such rights;

(4) If requested in writing by the insurer, the claimant shall take, through any representative not in conflict in interest with the claimant, designated by the insurer, such action as may be necessary or appropriate to recover such payment as damages from such uninsured person, such action to be taken in the name of the claimant, but only to the extent of the payment made hereunder. In the event of a recovery, the insurer shall be reimbursed out of such recovery for expenses, costs and attorney fees incurred by it in connection therewith; and

(5) The claimant shall execute and deliver to the insurer such instruments and papers as may be appropriate to secure the rights and obligations of the claimant and the insurer established by this provision.

SEC. 9. Payment of any benefit required by section 2 of this 1971 Act to or for any insured shall be applied in reduction of the amount of damage that the insured may be entitled to recover from any insurer under bodily liability or uninsured motorist coverage for the same accident.

Section 10. ORS 731.418 is amended to read:

731.418. (1) The commissioner may refuse to continue or may suspend or revoke an insurer's certificate of authority if he finds after a hearing that the insurer:

(a) Has violated or failed to comply with any lawful order of the commissioner, or any provision of the Insurance Code other than those for which suspension or revocation is mandatory;

(b) Is in un-sound condition, or in such condition or using such methods and practices in the conduct of its business, as to render its further transaction of insurance in this state hazardous or injurious to its policyholders or to the public.

(c) Has failed, after written request by the commissioner, to remove or discharge an officer or director who has been convicted in any jurisdiction of an offense which, if committed in this state, constitutes a misdemeanor involving

moral turpitude or a felony, or is punishable by death or imprisonment under the laws of the United States, in any of which cases the record of his conviction shall be conclusive evidence.

(d) Is affiliated with and under the same general management, interlocking directorate or ownership as another insurer that transacts direct insurance in this state without having a certificate of authority therefor, except as permitted under the Insurance Code.

(e) Refuses to be examined; or its directors, officers, employees or representatives refuse to submit to examination relative to its affairs, or to produce its accounts, records and files for examination by the commissioner when required, or refuse to perform any legal obligation relative to the examination.

(f) Has failed to pay any final judgment rendered against it in this state upon any policy, bond, recognizance or undertaking issued or guaranteed by it, within 30 days after the judgment became final, or within 30 days after time for taking an appeal has expired, or within 30 days after dismissal of an appeal before final determination, whichever date is the later.

(g) Fails to comply with subsection (1) of section 7 of this 1971 Act.

(2) Without advance notice or a hearing thereon, the commissioner may suspend immediately the certificate of authority of any insurer as to which proceedings for receivership, conservatorship, rehabilitation, or other delinquency proceedings, have been commenced in any state by the public insurance supervisory official of such state.

Section 11. ORS 743.786 is amended to read:

743.786. As used in ORS [743.789] 743.786 to 743.792:

(1) "Uninsured motorist coverage" means coverage within the terms and conditions specified in ORS 743.792 insuring the insured, his heirs or his legal representative for all sums which he or they shall be legally entitled to recover as damages for bodily injury or death caused by accident and arising out the ownership, maintenance or use of an uninsured motor vehicle in amounts or limits not less than the amounts or limits prescribed for bodily injury or death for a policy of insurance meeting the requirements of ORS chapter 486.

(2) "Motor vehicle" means every self-propelled device in, upon or by which any person or property is or may be transported or drawn upon a public highway, but does not include:

(a) Devices used exclusively upon stationary rails or tracks;

(b) Motor busses, motor trucks or taxicabs as defined in ORS 481.030, 481.035 and 481.050, when the insured has employees who operate such busses, trucks or taxicabs and such employees are covered by any workmen's compensation law, disability benefits law or any similar law; or

(c) Farm-type tractors or self-propelled equipment designed for use principally off public highways.

SEC. 12. This Act takes effect on January 1, 1972.

OREGON LEGISLATIVE ASSEMBLY—1971 REGULAR SESSION

HOUSE AMENDMENTS TO HOUSE BILL 1300

By COMMITTEE ON STATE AND FEDERAL AFFAIRS

May 6

On page 2 of the printed bill, line 7, delete "or delivered" and insert "for delivery".

OREGON LEGISLATIVE ASSEMBLY—1971 REGULAR SESSION

HOUSE BILL 1343

Sponsored by COMMITTEE ON JUDICIARY (at the request of the Committee on Procedure and Practice of the Oregon State Bar)

SUMMARY

The following summary is not prepared by the sponsors of the measure and is not a part of the body thereof subject to consideration by the Legislative Assembly. It is an editor's brief statement of the essential features of the measure as introduced.

Replaces doctrine of contributory negligence with doctrine of comparative negligence. Diminishes recovery proportionately to negligence of person recovering.

Note: Matter in bold face in an amended section is new; matter [italic and bracketed] is existing law to be omitted; complete new sections begin with Section.

A BILL FOR AN ACT Relating to comparative negligence in civil actions

Enacted by the People of the State of Oregon:

SECTION 1. Contributory negligence, including assumption of the risk, shall not bar recovery in an action by any person or his legal representative to recover damages for negligence resulting in death or injury to person or property if such negligence contributing to the injury was not as great as the negligence of the person against whom recovery is sought, but any damages allowed shall be diminished in the proportion to the amount of such negligence attributable to the person recovering.

| Features | Proposed National no-fault bill (Committee print No. 1 of S. 945) | Puerto Rico law (act No. 138 of 1968; effective July 1, 1968) | Massachusetts law (acts of 1970, c. 670 and 774; effective Jan. 1, 1971) | Florida law (acts of 1971, c. 71-252; effective Jan. 1, 1972) | Delaware law (H.B. No. 270 of 1971; effective Jan. 1, 1972) | Oregon law (H.B. No. 1851 of 1971; effective Jan. 1, 1972) | Illinois law |
|---|--|---|---|--|---|--|--|
| A. No-fault personal injury benefits: | | | | | | | |
| 1. Costs of medical, hospital, surgical, nursing, etc. services | All such expenses reasonably and necessarily incurred. | All that the condition of victim requires, in accordance with regulations of Automobile Accident Compensation Administration. | To a maximum limit of \$2,000; (must be incurred within 2 years of accident). | To a maximum limit of \$5,000. | To a maximum limit of \$20,000; for all persons injured in any 1 accident; \$10,000; for any 1 person. | All reasonable charges for reasonably necessary products, services and accommodations for an injured person's care, recovery and rehabilitation. | To a maximum limit of \$2,000. |
| 2. Rehabilitation. | All such expenses reasonably and necessarily incurred—for psychiatric, physical and occupational rehabilitation. | All as per regulations | None, except for cost of prosthetic devices. | do. | None, except for cost of prosthetic devices. | All reasonable charges for reasonably necessary services for injured person's rehabilitation. | None, except for cost of prosthetic devices. |
| 3. Lost wages, earnings and prospects of earnings. | All lost after income-tax earnings for period during which injury results in inability to work including lost earnings anticipated or reasonable expectable (up to \$1,000 a month, indefinitely). | 50 percent of lost salary, \$50 a week maximum for 1st 52 weeks, \$25 a week maximum for 2d 52 weeks. | 75 percent of actual lost wages to a maximum limit of \$2,000. | 85 percent of lost pre-income-taxes gross income and 100 percent of nontaxable lost income and loss of earning capacity to a maximum limit of \$5,000. | "Loss of earnings" to a maximum of \$20,000; for all persons injured in any one accident; \$10,000; for any 1 person. | \$750 maximum. | 85 percent of lost wages and salary to a limit of \$150 per week for 1st 52 weeks, nothing thereafter. |
| 4. Services victim would have performed for self and family. | All such expenses reasonably and necessarily incurred. | No such benefits. | To a maximum limit of \$2,000. | To a maximum limit of \$5,000. | To a maximum limit of \$20,000; for all persons injured in any 1 accident; \$10,000; for any 1 person. | \$750 maximum. | \$12 a day for 365 days. |
| 5. Funeral expenses. | do. | \$500. Also "death benefits" of \$5,000 to primary dependent; and \$1,000 to each "secondary dependent". | do. | \$1,000 maximum. | \$2,000 maximum. | \$1,000 maximum. | \$2,000 maximum. |
| 6. Attorneys fees. | All such expenses incurred in actually collecting benefits from insurer. | None. | None. | None. | None. | Reasonable amount if court finds insurer unreasonably refused to pay benefits or unreasonably delayed making proper payment. | None. |

See footnotes at end of table, p. 2434.

| Features | Proposed National no fault bill (Compromise print No. 1 of 9/45) | Puerto Rico law (act No. 138 of 1968, effective July 1, 1969) | Massachusetts law (acts of 1970, c. 670 and 774, effective Jan. 1, 1971) | Florida law (acts of 1971, c. 71 252, effective Jan. 1, 1972) | Delaware law (H.B. No. 270 of 1971, effective Jan. 1, 1972) | Oregon law (H.B. No. 1851 of 1971, effective Jan. 1, 1972) | Illinois law |
|--|--|---|--|--|--|--|--|
| B. Intangible personal benefits. | All intangible losses, without regard to fault, measured by applicable state law (optional for insured drivers; mandatory for uninsured pedestrians and passengers). | No such benefits. Pay "disbursement benefits" up to \$5,000. | None | None | None | None | Do. |
| C. No fault property injury benefits. | An amount equal to the loss, subject to optional deductibles. | None | None at present. Legislation to provide now pending. | An amount equal to the loss (optional). | To a maximum of \$300 for loss of use, actual cash value maximum as to vehicle, \$5,000 maximum for property other than motor vehicle. | Optional as to damage to motor vehicle owned by insured; mandatory as to damage to property other than a motor vehicle. | Do. |
| D. Treatment of collateral sources of benefits. | Only as to any public health insurance or plan or any private insurance or plan explicitly so providing. | Benefits received from other sources deducted from benefits under act, except when otherwise provided. | Only as to payments under any program for "continuation of wages or salary or their equivalent" and as to workmen's compensation benefits. | Only as to benefits received under any workmen's compensation law. | No provision. | No provision. | No provision. |
| E. Freedom from tort lawsuits. | Total. No owner, operator, or driver shall be liable for tort damages unless engaged in criminal conduct. | Exempted from tort liability to extent of benefits received by victim unless loss exceeds \$5,000. | Exempted from suit in tort unless plaintiff's hospital and medical expenses more than \$500. | Exempted to extent of no-fault benefits payable to plaintiff; exempted from suit in tort unless plaintiff's hospital and medical expenses more than \$1,000. | No exemption whatever. Plaintiff precluded from proving damages for which first party compensation is available. | No exemption whatever. After a tort recovery, amount of first-paid benefits received to be subtracted and paid to insurer. | No exemption whatever. But there is a limitation on the amount of general damages recoverable in a tort lawsuit (50 percent of medical costs up to \$500; 100 percent of medicals over \$500). |
| F. Insurance company lawsuits (subrogation) permitted. | No. | Administration entitled to indemnity from person responsible in case of criminal conduct intentional injury, etc. | Yes | Yes | Yes | Yes | Yes. |

G. Consumer safeguards:

| | | | | | | | |
|--|--|---|---|---|---|--|---|
| 1. Payment of no-fault benefits — protection in case of refusal to pay by insurer. | Payments made as loss is incurred; if unpaid within 30 days, insurer also must pay interest, at the rate of 2 percent per month on the unpaid amount plus attorney's fees if victim must go to court to collect. | Payments made on a weekly basis. Entire system operated by Government agency. | Benefits paid as loss accrues; if unpaid within 30 days, claimant may sue insurer in contract. | Benefits unpaid within 30 days of date due, insurer also must pay interest, at the rate of 10 percent per annum on the unpaid amount. | No particular method required; no protection in case of nonpayment. | Benefits paid as loss accrues; if unpaid within 30 days insurer must also pay interest at rate of 6 percent per annum on unpaid amount and attorney's fees if unreasonable refusal to pay. | No particular method required; no protection in case of nonpayment. |
| 2. Availability of Insurance. | Policy cannot be cancelled, must be renewed and must be sold to each applicant unless insured or applicant has no valid operator's license or has failed to pay premiums. States to continue regulating rates except that DOT, with industry and States, will set policyholder classifications and policy standards. |do..... | Subject to exceptions: Policies of those 65 or older, and of those under 65 who are entitled to merit rating discount must be renewed. | No provision for guarantee of availability of insurance. | "Nothing . . . shall be construed to require an insurer to insure any particular risk." | No provision to pay. | No provision. |
| 3. Rate regulation and policyholder classifications and policy standards. | States to continue regulating rates except that DOT, with industry and States, will set policyholder classifications and policy standards. |do..... | No change. | No change. | No change. | No change. | No change. |
| 4. Price and claims. Practice disclosure. | All insurers must disclose under a uniform statistical plan, data on claims and loss experience and price of policies. DOT to make this analysis and make information available. |do..... | No change. No disclosure required in No-Fault law. | No change. No disclosure required under No-Fault law. | No change. No disclosure required. | No change. No disclosure required. | No change. No disclosure required. |
| 5. Protection of Beneficiaries. | No part of no-fault personal injury benefits may be applied as attorney's fees; contingent fees permitted as to intangible personal benefits and no-fault property benefits but limited to 25 percent of any award claimant receives. |do..... | Insurer and claimant may agree to lump sum discharging all no-fault benefit entitlement; no prohibition or restriction of attorney's contingent fees. | No provision. | No provision. | Lump sum payments in excess of \$1,000 must first be approved by court; an agreement for assignment of any rights to benefits payable in the future is unenforceable." | None. |

See footnotes at end of table, p. 2434.
